Determination of Dynamic Properties of Soils
(Seismic Refraction Survey-Inclined Layering)

Hello friends. Today we will discuss the seismic refraction survey considering inclined layering. In last class we have studied seismic refraction survey considering horizontal layering but today we will see what is the difference in the velocity or in the calculation of the velocity of P wave in the calculation of the thickness of layers when the layers are inclined to the horizontal plane.

(Refer Slide Time: 1:19)

Let us see figure 28.1. So, in this figure A is the source of disturbance, D is any point at which geophones are placed to record the first arrival of the P wave. Now, what is happened, when we create disturbance at A, P wave starts to propagate and its wavefront is spherical wavefront.

So, up to some distance R, what we can see? Up to some distance R we see that the direct wave reaches the ground surface before the reflected wave or refracted wave. So, in this case we are considering refracted wave, so at point R which is not too far from the source A there direct wave will arrive before the refracted wave.

However, at point D the direct wave, before direct wave refracted wave will arrive. So, now if we will plot the first arrival time and the distance when A is the source of disturbance what

we can get, we get two curves, one is oa this is for the direct wave and ab for the refracted wave, so this is for refracted wave, when a is the source.

Now, for the direct wave what is the arrival time? The arrival time of the direct wave is the distance a r divided by the velocity of the P wave in layer 1 which is v_{p1} . In this case one thing we should note is that the velocity of the P wave in layer 1 is lower than the magnitude of the velocity of P wave in layer 2. That means P wave moves faster velocity in layer 2.

So, the travel time of first arrival wave is in this case x divided by v_{p1} , I can write here also x divided by v_{p1} . Now, for the refracted wave what is the travel time? For the refracted wave the travel time is the travel time for a b, the travel time for B C and the travel time of C D if we will sum these three travel times together we will get the travel time for the refracted wave AB C D.

(Refer Slide Time: 5:22)

Seismic Refraction Test in Soil with Inclined Layering

- A few spherical wavefronts originating at A can strike the interface of the two layers at different points.
- There is one refracted P-wavefront in the lower layer (at a point B) for which the tangent drawn to the sphere is perpendicular to the interface of the two layers.
- In such case, the refracted P-wave is parallel to the boundary and travels with a velocity v_{p2} .
- Snell's law: $\frac{\sin i_1}{v_{p1}} = \frac{\sin i_2}{v_{p2}}$ -- [2]
- In this case at C, $i_1 = i_c$ and $i_2 = 90^\circ$ so Equation [2] is written as: $\frac{\sin i_c}{v_{p1}} = \frac{\sin 90^\circ}{v_{p2}}$ -- [3]
- This wavefront travelling with a velocity v_{p2} may create vibrating stresses at the interface.
- The vibrating stresses at the interface can generate the wavefront spreading out into the upper layer

$$i_c = \sin^{-1} \left(\frac{v_{p1}}{v_{p2}} \right)$$

So as I said a few spherical wavefronts originating at A can strike the interface of the two layers at different points. There is one refracted P wavefront in the lower layer for which the tangent drawn to the sphere is perpendicular to the interface of two layers these things we have seen in last class also.

And in such case, the refracted P wave is parallel to the boundary, in this case it is inclined boundary and travels with a velocity v_{p2} . That means for the path B C P wave travels with a velocity v_{p2} . Then we can use Snell's law and using that we can write sin of i_1 divided by v_{p1} is equal to sin of i_2 divided by v_{p2} .

Now, i_1 is equal to i_c that means critical angle for i_3 is equal to 90 degree, that means when the refracted wave travels along the boundary, this case. So, that time what we can write? We can write actually $\sin i_c$ divided by v_{p1} is equal to \sin , in place of i_3 I can write $\sin 90$ degree divided by v_{p2} , so from this I can write i_c is equal to $\sin^{-1} v_{p1} / v_{p2}$.

This wavefront traveling with a velocity v_{p2} may create vibrates, vibrating stresses at the interface. As a consequence, the vibrating stress at the interface can generate the wavefront spreading out into the layer 1 once again.

(Refer Slide Time: 7:50)

Seismic Refraction Test in Soil with Inclined Layering

Fig. 28.1(a)

In Fig. 28.1 (a), the travel time of P-wave travelling along ABCD:

$$t = t_{AB} + t_{BC} + t_{CD} = \frac{AB}{v_{p1}} + \frac{BC}{v_{p2}} + \frac{CD}{v_{p1}}$$

So, B C now change its path and follow the path C D. So, this time this case the travel time of the P wave is t is equal to travel time for the path AB plus travel time for the path BC plus travel time for the path CD, which is equal to AB divided by v_{p1} plus BC divided by v_{p2} plus CD divided by v_{p1} . So, now if I know the distance AB, BC and CD then I can get the travel time T easily.

(Refer Slide Time: 8:38)

$$\begin{aligned}
 t &= t_{AB} + t_{BC} + t_{CD} \\
 &= \frac{z'}{v_1 \cos i_c} + \frac{x \cos \theta - z' \tan i_c - x \sin \theta \tan i_c}{v_2} + \frac{x}{v_1 \cos i_c} + \frac{x \sin \theta}{v_1 \cos i_c} \\
 &= \frac{z'}{v_1 \cos i_c} - \frac{z' \tan i_c}{v_2} + \frac{x \cos \theta - x \sin \theta \tan i_c}{v_2} + \frac{x \sin \theta}{v_1 \cos i_c} \\
 &= \frac{z'}{v_1 \cos i_c} - \frac{z' \sin i_c}{v_2 \cos i_c} + \frac{x \cos \theta - x \sin \theta \frac{\sin i_c}{\cos i_c}}{v_2} + \frac{x \sin \theta}{v_1 \cos i_c} \\
 &= \frac{z' (v_2 - v_1 \sin i_c)}{v_1 v_2 \cos i_c} + \frac{x \cos \theta \cos i_c - x \sin \theta \sin i_c}{v_2 \cos i_c} + \frac{x \sin \theta}{v_1 \cos i_c}
 \end{aligned}$$

Seismic Refraction Test in Soil with Inclined Layering

Fig. 28.1(a)

➤ In Fig. 28.1 (a), the travel time of P-wave travelling along ABCD:

$$t = t_{AB} + t_{BC} + t_{CD} = \frac{AB}{v_{p1}} + \frac{BC}{v_{p2}} + \frac{CD}{v_{p1}} \quad \dots (4)$$

➤ Now, $AB = \frac{A_2 A_1}{\cos i_c} = \frac{z'}{\cos i_c}$, $CD = CA_3 + DA_4 = \frac{z'}{\cos i_c} + \frac{x \sin \theta}{\cos i_c}$

$$BC = AA_4 - AA_1 - A_2 A_3 - A_3 A_4 = x \cos \theta - z' \tan i_c - z' \tan i_c - x \sin \theta \tan i_c$$

So, let us do this exercise here. So, t is equal to t_{AB} plus t_{BC} plus t_{CD} , t_{AB} means AB divided by v_{p1} that is already written. So, what is AB here? We can write AB in terms of Z dashed so if I will write AB in terms of Z dashed then AB can be written as Z dash divided by $\cos i_c$ as per this diagram.

So, AB can be written as Z dashed divided by $\cos i_c$. So, here in place of AB , I am just writing Z dashed divided by $\cos i_c$ divided by v_{p1} , so like this. Now, come to BC . BC means what? BC means I can write BC as AA_4 minus AA_1 minus $A_2 A_3$ minus $A_3 A_4$. So, I am just writing here itself or I can write it is here already written, so I am just writing.

So, you can see BC means AA_4 minus AA_1 minus $A_2 A_3$ minus $A_3 A_4$. So, AA_1 that means this distance is how much? Sorry, not AA_1 , AA_4 . AA_4 means this total distance which is

equal to $x \cos \theta$ as per this diagram the angle DA_4 I am writing here angle DA_4 is 90 degree and angle $DA_4 A_4$ is θ .

So, I can write in place of AA_4 , in place of AA_4 I can write $x \cos \theta$ likewise in place of AA_1 what we can write? In place of AA_1 we can write $Z \cos \theta$ because tangent of $i c$ means what AA_1 I am just writing here tangent of $i c$ means AA_1 divided by $A_1 B$, $A_1 B$ is $Z \cos \theta$ so we can write AA_1 is equal to $Z \cos \theta$ times tangent of $i c$.

Similarly for $A_2 A_3$ also we can write $A_2 A_3$ is equal to $Z \cos \theta$ times tangent of $i c$. Next is $A_3 A_4$. So, $A_3 A_4$ means as per this diagram if I am writing $A_3 A_4$ that is equal to what I can write is DA_4 times tangent of $i c$ this angle is also $i c$. Now, what is DA_4 ? For DA_4 we can consider the triangle $DA_4 A_4$, if we consider the triangle $DA_4 A_4$ then DA_4 is equal to $x \sin \theta$ so DA_4 is $x \sin \theta$ times tangent of $i c$.

Now, we know the expression for AA_4 we know the expression for AA_1 , $A_2 A_3$, $A_3 A_4$. So, if we will write it, it becomes this, already it is, how it is coming that is written. So, I am just writing the what is t_{BC} . So, in this case t_{BC} is, t_{BC} is $x \cos \theta$ minus $2Z \cos \theta$ times tangent of $i c$ so I can write $2Z \cos \theta$ times tangent of $i c$ then minus $x \sin \theta$ times tangent of $i c$ divided by $v \sqrt{2}$ because the wave travels with a velocity $v \sqrt{2}$ along the path BC plus t_{CD} .

So, t_{CD} here is the path CA_3 plus DA_3 , so CD means CA_3 plus DA_3 which is already written you can see $Z \cos \theta$ divided by $\cos i c$ plus DA_3 means again we can write it as DA_4 times DA_4 divided by $\cos i c$ so DA_4 means already I think yes we have written it is equal to $x \sin \theta$. So, in place of CD we can use this expression.

So, I am writing here $Z \cos \theta$ plus $x \sin \theta$, sorry $\sin \theta$ times tangent, sorry $\sin \theta$ divided by $\cos i c$ divided by $v \sqrt{2}$, so $\cos i c$. Now, what I can do here, I can take the term $Z \cos \theta$ together. So, I have one term like this $v \sqrt{2} \cos i c$. So, the two terms which I have already consider are these two terms.

Now, again what is left is minus $2Z \cos \theta$ times tangent of $i c$ divided by $v \sqrt{2}$ and whatever is left that I am writing together. So, $x \cos \theta$ minus $x \sin \theta$ times tangent of $i c$ divided by $v \sqrt{2}$ plus $x \sin \theta$ divided by $v \sqrt{2} \cos i c$. Now, these first two term what we can do for these first two term let us see.

So, here I am writing it as $2Z \cos \theta$ divided by $v \sqrt{2} \cos i c$ minus tangent $i c$ can be written as $\sin i c$ divided by $\cos i c$. So, I am writing it test divided by $\cos i c$

plus the same thing I am doing here also in place of tangent of $i c$ I will write cosine of $i c$, sorry sin of $i c$ divided by cosine of $i c$ this divided by $v p 2$ plus $x \sin \theta$ divided by $v p 1$ cosine $i c$.

Now, the first two term can be written as, I can write it as $v p 1 v p 2$ times cosine $i c$, so $2Z$ dashed which is common for first two terms, so I am writing $2Z$ dashed and then multiplying the remaining components of first term and the second term within bracket as what it will be, it will be then $v p 2$ minus $v p 1 \sin i c$ plus I can write this also as $x \cos \theta \cos i c$ minus $x \sin \theta \sin i c$ plus this term as it is.

Now, here what I can do for the, now we have three terms basically, this is one, this is another, this is the third. So, for the first term what I can do, I can take $v p 2$ out of this bracket.

(Refer Slide Time: 20:08)

$$= \frac{x^2 v_2 \left(1 - \frac{v_1}{v_2} \sin ic\right)}{v_1 v_2 \cos ic} + \frac{x (\cos ic - \sin ic)}{v_2 \cos ic} + \frac{x \sin \theta}{v_1 \cos ic}$$

$$\sin ic = \frac{v_1}{v_2}$$

$$= \frac{z' \frac{1}{v_2} (1 - \frac{v_1}{v_2} \sin^2 \theta_c)}{v_1 v_2 \cos^2 \theta_c} + \frac{z (\cos^2 \theta_c - \sin^2 \theta_c)}{v_2 \cos^2 \theta_c} + \frac{z \sin \theta_c}{v_1 \cos^2 \theta_c}$$

$$= \frac{z' \frac{1}{v_2} (1 - \sin^2 \theta_c)}{v_2 v_1 \cos^2 \theta_c} + \frac{z \cos \theta_c}{v_2} +$$

$$= \frac{z' \frac{1}{v_2} (1 - \sin^2 \theta_c)}{v_1 v_2 \cos^2 \theta_c} + \frac{z \cos \theta_c}{v_2} - \frac{z \sin \theta_c \sin^2 \theta_c}{v_2 \cos^2 \theta_c} + \frac{z \sin \theta_c}{v_1 \cos^2 \theta_c}$$

$$= \frac{z' \cos^2 \theta_c}{v_1} + \frac{z \cos \theta_c}{v_2} + \frac{z \frac{1}{v_2} (\sin \theta_c)}{v_1 v_2 \cos^2 \theta_c}$$

$$= \frac{z' \frac{1}{v_2} (1 - \sin^2 \theta_c)}{v_1 v_2 \cos^2 \theta_c} + \frac{z (\cos^2 \theta_c - \sin^2 \theta_c)}{v_2 \cos^2 \theta_c} + \frac{z \sin \theta_c}{v_1 \cos^2 \theta_c}$$

$$= \frac{z' \frac{1}{v_2} (1 - \sin^2 \theta_c)}{v_2 v_1 \cos^2 \theta_c} + \frac{z \cos \theta_c}{v_2} - \frac{z \sin \theta_c \sin^2 \theta_c}{v_2 \cos^2 \theta_c} + \frac{z \sin \theta_c}{v_1 \cos^2 \theta_c}$$

$$= \frac{z' \cos^2 \theta_c}{v_1} + \frac{z \cos \theta_c}{v_2} + \frac{z \sin \theta_c (\frac{v_2 \cos^2 \theta_c}{v_2 - v_1 \sin^2 \theta_c})}{v_1 v_2 \cos^2 \theta_c}$$

$$= \frac{z' \cos^2 \theta_c}{v_1} + \frac{z \cos \theta_c}{v_2} + \frac{z \sin \theta_c \cos^2 \theta_c}{v_1}$$

$$\begin{aligned}
 t &= t_e + t_c + t_o \\
 &= \frac{z'}{v_1 \cos i} + \frac{x \cos \theta - 2z' \sin i c - x \sin \theta \sin i c}{v_2} + \frac{x z'}{v_1 \cos i} + \frac{x \sin \theta}{v_1 \cos i} \\
 &= \frac{2z'}{v_1 \cos i} - \frac{2z' \sin i c}{v_2} + \frac{x \cos \theta - x \sin \theta \sin i c}{v_2} + \frac{x \sin \theta}{v_1 \cos i} \\
 &= \frac{2z'}{v_1 \cos i} - \frac{2z' \sin i c}{v_2 \cos i} + \frac{x \cos \theta - x \sin \theta \frac{\sin i c}{\cos i}}{v_2} + \frac{x \sin \theta}{v_1 \cos i} \\
 &= \frac{2z' (v_2 - v_1 \sin i c)}{v_1 v_2 \cos i} + \frac{x \cos \theta \cos i c - x \sin \theta \sin i c}{v_2 \cos i} + \frac{x \sin \theta}{v_1 \cos i}
 \end{aligned}$$

$A_0 = \frac{z'}{\cos i}$

So, I am writing the first term here as $2Z$ dashed taking out v_2 so one minus v_1 divided by $v_1 v_2$, sorry v_2 , v_2 that is multiplying with $\sin i c$ divided by $v_1 v_2$ times cosine of $i c$, so this is the first term. Now, what about the second term? For second term I can take x out of this bracket.

So, taking x out cosine theta cosine $i c$ minus sin theta sin $i c$ that is divided by v_2 cosine $i c$ here if you see the second term it is v_2 cosine $i c$. So, I am writing here v_2 cosine $i c$. And the last term, $x \sin \theta$ divided by v_1 cosine $i c$. Now, come to the first term what is v_1 divided by v_2 ?

If you recall we have written already $\sin i c$ is equal to v_1 divided by v_2 . So, here I can write directly v_1 by v_2 in place of v_1 by v_2 I am writing $\sin i c$, $2Z$ dashed v_2 , so $\sin i c$ in place of v_1 by v_2 and there is another $\sin i c$ so it is becoming $\sin^2 i c$ divided by $v_2 v_1$ times cosine of $i c$.

Now, come to the second term. So, what I can write in place of second term now? So, first term is written like this, now come to the second term. For second term what we can write let us give a try for the second term. So, second term let us write it other way, instead of writing it as these I am just once again writing the second term as x of cosine theta divided by v_2 plus, not plus if you see there is a negative sign here, so it is minus $x \sin \theta \sin i c$ divided by $v_2 \cos i c$ plus $x \sin \theta$ divided by $v_1 \cos i c$.

So, from this what I can write, for the first term now it is in what I can write this is nothing but cosine square $i c$ and if you see that denominator we have v_2 times v_1 times cosine i

c. So, after simplifying what we can write? We can write then $2Z$ dashed times cosine i c divided by $v p 1$.

Second term I am writing as it is now third and fourth term I am trying to simplify here as $v p 1 v p 2$ times cosine i c, so it is now x if I will take out $v p 2$ also I can take out so \sin theta or I can write \sin theta out actually in instead of writing this way, I can write it $x \sin$ theta taking out so what is left here is $v p 2$ minus $v p 1 \sin i c$ already we have seen that these can be written as I can just write for you $2Z$ dashed cosine i c divided by $v p 1$ plus $x \cos$ theta divided by $v p 2$ plus what I can write in whatever written within bracket.

In place of that I can write $v p 2$ times 1 minus \sin square i c which is cosine square i c, so if it is like that then we can write $x \sin$ theta times cosine i c divided by $v p 1$ that is something is left or missing, no, it is all right. So, now in the next line what I will do I will take second and third term together and will keep first term as it is.

(Refer Slide Time: 27:22)

$$\begin{aligned}
 t &= \frac{2z' \cos ic}{v_1} + \frac{x(v_1 \cos \theta + v_2 \sin \theta \cos ic)}{v_1 v_2} \\
 &= \frac{2z' \cos ic}{v_1} + \frac{x v_2 \left(\frac{v_1}{v_2} \cos \theta + \sin \theta \cos ic \right)}{v_1 v_2} \\
 &= \frac{2z' \cos ic}{v_1} + \frac{x v_2 (\sin ic \cos \theta + \sin \theta \cos ic)}{v_1 v_2} \\
 t &= \frac{2z' \cos ic}{v_1} + \frac{x \sin ic \cos \theta}{v_1}
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{z^2 v_2 (1 - \frac{v_1}{v_2} \sin i_c)}{v_1 v_2 \cos i_c} + \frac{x (\cos \theta \cos i_c - \sin \theta \sin i_c)}{v_2 \cos i_c} + \frac{x \sin \theta}{v_1 \cos i_c} \\
 &= \frac{z^2 v_2 (1 - \frac{v_1}{v_2} \sin i_c)}{v_2 v_1 \cos i_c} + \frac{x \cos \theta}{v_2} - \frac{x \sin \theta \sin i_c}{v_2 \cos i_c} + \frac{x \sin \theta}{v_1 \cos i_c} \\
 &= \frac{z^2 \cos i_c}{v_1} + \frac{x \cos \theta}{v_2} + \frac{x \sin \theta (\frac{v_2 \cos i_c}{v_2} - v_1 \sin i_c)}{v_1 v_2 \cos i_c} \\
 &= \frac{z^2 \cos i_c}{v_1} + \frac{x \cos \theta}{v_2} + \frac{x \sin \theta \cos i_c}{v_1}
 \end{aligned}$$

Seismic Refraction Test in Soil with Inclined Layering

Fig. 28.1(a)

▶ In Fig. 28.1 (a), the travel time of P-wave travelling along ABCD:

$$t = t_{AB} + t_{BC} + t_{CD} = \frac{AB}{v_{p2}} + \frac{BC}{v_{p2}} + \frac{CD}{v_{p1}} \quad \dots (4)$$

▶ Now, $AB = \frac{AA_2 B}{\cos i_c} = \frac{z'}{\cos i_c}$, $CD = CA_3 + DA_3 = \frac{z'}{\cos i_c} + \frac{x \sin \theta}{\cos i_c}$

$$BC = AA_4 - AA_1 - A_2 A_3 - A_3 A_4 = x \cos \theta - z' \tan i_c - z' \tan i_c - x \sin \theta \tan i_c$$

$\angle DAA_1 = 30^\circ$

$\angle DAA_2 = \theta$

$AA_1 = x \cos \theta$

$\tan i_c = \frac{AA_2}{AB}$

$\Rightarrow AA_2 = z' \tan i_c = A_2 A_3$

$A_3 A_4 = DA_4 \tan i_c$

$= x \sin \theta \tan i_c$

So, then travel time is now $\frac{2Z \cos i_c}{v_1}$ divided by v_1 plus here what I will do I will now add second and third term together. Then we are getting x I will take out, so v_2 , previous page, it is $v_2 \cos \theta$, $v_2 \cos \theta$ then plus $v_2 \sin \theta \cos i_c$.

So, we can write now the new second term first term as it is, the new second term here we can take, we need to take one term out, so v_2 I can take out then I can write it as $x v_2$ times v_1 divided by v_2 times $\cos \theta$ plus $\sin \theta \cos i_c$, this is divided by $v_1 v_2$.

Now in place of $v_1 v_2$ what I can write, I can write it as once again $\sin i_c$, so in this way the second term can be written here as x times v_2 times $\sin i_c \cos \theta$ plus $\sin \theta$

cosine i_c and that is divided by v_{p1} times v_{p2} . Now, here you can see in the numerator and denominator we can get v_{p2} and v_{p2} is a non zero number.

So, we can simplify here, the second term and finally we get x divided by v_{p1} times whatever written in the bracket, that means x sorry $\sin i_c$ times cosine theta plus \sin theta times cosine i_c . And what it is exactly? Whatever written within bracket in place of that what we can write is \sin of i_c plus theta. So, here I will write then i_c plus theta. So, what I have shown here is that the total travel time for the path A B C D, A B C D is this one. So, now go back to the PPT and here you can see the total travel time in the next slide.

(Refer Slide Time: 31:24)

Seismic Refraction Test in Soil with Inclined Layering

➤ From Equation (4) and (5), we can get:

$$t_d = t_{AB} + t_{BC} + t_{CD} = \frac{2z' \cos i_c}{v_{p1}} + \frac{x}{v_{p1}} \sin(i_c + \theta) \quad \text{--- (6)}$$

➤ Now if we interchange the source of disturbance and the receiver position then:

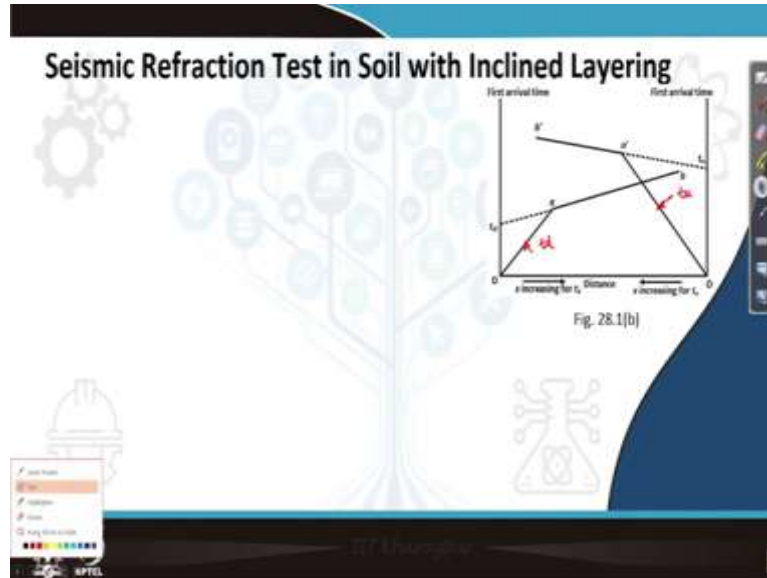

$$t_u = \frac{2z' \cos i_c}{v_{p1}} + \frac{x}{v_{p1}} \sin(i_c - \theta) \quad \text{--- (7)}$$

$$\begin{aligned}
 t &= \frac{2z' \cos i_c}{v_{p1}} + \frac{x (v_{p1} \cos \theta + v_{p2} \sin \theta \cos i_c)}{v_{p1} v_{p2}} \\
 &= \frac{2z' \cos i_c}{v_{p1}} + \frac{x v_{p2} \left(\frac{v_{p1}}{v_{p2}} \cos \theta + \sin \theta \cos i_c \right)}{v_{p1} v_{p2}} \\
 &= \frac{2z' \cos i_c}{v_{p1}} + \frac{x v_{p2} (\sin i_c \cos \theta + \sin \theta \cos i_c)}{v_{p1} v_{p2}} \\
 t &= \frac{2z' \cos i_c}{v_{p1}} + \frac{x \sin(i_c + \theta)}{v_{p1}}
 \end{aligned}$$

Yeah, so this thing if you see we have already expressed, just let me check, yeah, same thing we have already derived. Now, if we will interchange the position of the source and the

receiver then the travel time will become t_u which is equal to $2Z \cos i_c$ times $\frac{v_p1}{v_p1 + x}$ divided by $v_p1 \sin i_c$ minus θ .

(Refer Slide Time: 32:20)

Seismic Refraction Test in Soil with Inclined Layering

- During field test, after creating the disturbance at A one can record the first arrival time at several places to the right of A and plot the curve Oab from the field test results.
- Similarly, after creating the disturbance at D one can record the first arrival time at several places to the left of D and plot the curve Oa'b' from the field test results.
- Slopes of ab (m_a) and a'b' (m_a') are given below:

$$m_a = \frac{\sin(i_c + \theta)}{v_{p1}} \quad \text{--- (8)}$$

$$m_a' = \frac{\sin(i_c - \theta)}{v_{p1}} \quad \text{--- (9)}$$
- From Equations (8) and (9), i_c and θ can be calculated.

$$\begin{aligned}
 t &= \frac{2z \cos i}{v_1} + \frac{x(v_1 \cos \theta + v_2 \sin \theta \cos i)}{v_1 v_2} \\
 &= \frac{2z \cos i}{v_1} + \frac{x v_2 \left(\frac{v_1}{v_2} \cos \theta + \sin \theta \cos i \right)}{v_1 v_2} \\
 &= \frac{2z \cos i}{v_1} + \frac{x v_2 (\sin i \cos \theta + \sin \theta \cos i)}{v_1 v_2} \\
 t &= \frac{2z \cos i}{v_1} + \frac{x \sin(i+\theta)}{v_1} \Rightarrow t_d = \frac{2z \cos i}{v_1} + \frac{x \sin(i+\theta)}{v_1} \\
 &\Rightarrow m_d = \frac{\sin(i+\theta)}{v_1}
 \end{aligned}$$

$$\begin{aligned}
 t_u &= \frac{2z \cos i}{v_1} + \frac{x \sin(i-\theta)}{v_1} \\
 m_u &= \frac{\sin(i-\theta)}{v_1}
 \end{aligned}$$

So, that means now if I will write the two travel times that means this is t_d and this one t_u . Of course we need to take care of one thing here which is better I should not show t_d and t_u like this way better I show this is t_d and this is t_u , the expression of t_d and t_u I have already shown.

And o_a and o_a dashed represent the equation for the direct, for the travel time of the direct wave not the refracted one. So, this is for direct wave, same thing here also this is for direct wave. So, during field test, after creating the disturbance at A one can record the arrival time T at several places from the right of A, from the A towards the right of A and plot the curve Oab like this.

Similarly, after creating the disturbance at D that means we are interchanging now the position of the receiver and the position of the source and the receiver and recording the first

arrival time, one can record the first arrival time at several places to the left of D and plot the curve Oa dashed b dashed as shown this one.

Then the slope m_d that means the slope of the line ab and the slope of the line a dash b dashed which is m_u can be written as what is m_d if you see the equation from this is for the t_d I can write it also the same for t_d I am just writing plus x times \sin of i_c plus θ divided by v_{p1} so when it is for, then what is m_d here? m_d is nothing but \sin of i_c plus θ divided by v_{p1} .

Likewise if you see the equation for t_u it says that $2Z$ double dashed cosine i_c divided by v_{p1} plus x times \sin i_c minus θ divided by v_{p1} . And in that case m_u is slope of this straight line which is \sin of i_c minus θ divided by v_{p1} . So, with these we can write then here m_d is equal to \sin of i_c plus θ divided by v_{p1} and in place of m_u we can write \sin of i_c minus θ divided by v_{p1} . So, from equation 8 and 9 we can calculate we can determine i_c which is the inclination of the boundary of the two layers and i_c is the incident angle of the wave, P wave at the boundary and θ is the inclination of the boundary between two layers so that these two parameters can be determined by solving equation 8 and 9.

Seismic Refraction Test in Soil with Inclined Layering

- $i_c = \frac{1}{2} [\sin^{-1}(v_{p1} m_d) + \sin^{-1}(v_{p1} m_u)]$... [10]
- $\theta = \frac{1}{2} [\sin^{-1}(v_{p1} m_d) - \sin^{-1}(v_{p1} m_u)]$... [11]
- The velocity of the P-wave in layer-2 can be calculated as:

$$v_{p2} = \frac{v_{p1}}{\sin i_c} \quad \dots [12]$$
- Again, referring Fig. 28.1(b), we can get t_u and t_d .
- Theoretically, t_u and t_d equal to:

$$t_{ud} = \frac{2z' \cos i_c}{v_{p1}} \text{ and } t_{du} = \frac{2z' \cos i_c}{v_{p1}}$$

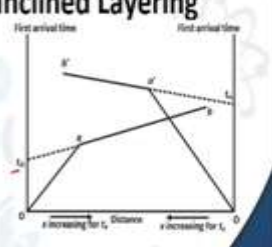

Fig. 28.1(b)

APTEL

$$t_b = \frac{2z' \cos i_c}{v_1} + \frac{x \sin(i_c - \theta)}{v_1}$$

$$m_u = \frac{\sin(i_c - \theta)}{v_1}$$

$$x=0 \Rightarrow t_b = t_a = \frac{2z' \cos i_c}{v_1}$$

$$x=0 \Rightarrow t_b = t_d = \frac{2z' \cos i_c}{v_1}$$

$$t = \frac{2z' \cos i_c}{v_1} + \frac{x (v_1 \cos \theta + v_2 \sin \theta \cos i_c)}{v_1 v_2}$$

$$= \frac{2z' \cos i_c}{v_1} + \frac{x v_2 \left(\frac{v_1}{v_2} \cos \theta + \sin \theta \cos i_c \right)}{v_1 v_2}$$

$$= \frac{2z' \cos i_c}{v_1} + \frac{x v_2 (\sin i_c \cos \theta + \sin \theta \cos i_c)}{v_1 v_2}$$

$$= \frac{2z' \cos i_c}{v_1} + \frac{x \sin(i_c + \theta)}{v_1}$$

$$\Rightarrow t_d = \frac{2z' \cos i_c}{v_1} + \frac{x \sin(i_c + \theta)}{v_1}$$

$$\Rightarrow m_d = \frac{\sin(i_c + \theta)}{v_1}$$

So, if you solve you will get i_c is equal to half of \sin^{-1} of m_d times $v_p 1$ plus \sin^{-1} of m_u times $v_p 1$. And θ is equal to half of \sin^{-1} of m_d times $v_p 1$ minus \sin^{-1} of m_u times $v_p 1$. So, from this, now what we know? We know three things, first we know $v_p 1$ which is the velocity of the P wave in layer one, we know i_c , we know θ .

So, I am just once again drawing this curve this is for $o a$, this is $a b$, so $o a$, $a b$, so this slope of $o a$ is nothing but $v_p 1$ and the slope of this $a b$ is m_u . From these we can now calculate what is the value of $v_p 2$. So, for that we if, when we know $v_p 1$ we can directly use Snell's law and find out $v_p 2$ which is equal to $v_p 1$ divided by \sin of i_c already we have determined i_c from equation 10.

Again if you see this figure 28.1 b what we can see if we extend back the curve a b then it intersect the vertical axis at some point which is t_{id} . Similarly, if we extend back the curve b dash a dash that will intersect the time axis at t_{iu} , that means for at t_{id} x is equal to 0 for the wave following the path A B C D and for t_{iu} x is equal to 0 for the wave traveling the path D C B A.

Then what is the value of t_{id} ? So, in this equation if we put x is equal to 0 then we get t_u is equal to t_{iu} which is $2Z \cos i_c$ divided by v_{p1} likewise for the first equation if I will write x is equal to 0 then I will get t_d is equal to t_{id} which is equal to $2Z \cos i_c$ divided by v_{p1} . I am just going back to the previous, yes. Here you can see if I will write x is equal to 0 here then it will be this expression. So, that is written at the end of this slide.

SUMMARY

In this lecture following topics related to dynamic properties of soils are discussed:

- Seismic refraction test in two-layered soil with inclined layering
- Determination of the thickness of layers, inclination of layering

MPPTEL MPPTEL

So, come to the summary of today's class. Today we have discussed the refraction, seismic refraction test in two layered soil considering inclined layering and here we have studied how to find out the velocity of P wave in layer 1, in layer 2, how to find out the thickness of the layers and how to find out the inclination of the boundary between two layers.

(Refer Slide Time: 41:19)

These are the references which I have used for today's class. So, thank you.
