Lecture: 13
3-Node Constant Strain Triangle

And in the previous class we had derived the equilibrium equations for a continuum and then we have also seen how to develop our shape functions and let us continue in today's class and apply our concepts to it the simplest continuum finite element that we can think of that is the 3 node constant strain triangle. Let us we will see why we call this as a constant strain triangle as we go along.

(Refer Slide Time: 00:57)

Different terms to be evaluated in finite element analysis

Stiffness matrix, $[K] = \int_v [B]^T [D] [B] dv$

vector of external concentrated forces on element nodes = $\{q^e\}$

Force vector due to surface traction = $\int_s [N]^T \{t\} ds$

Force vector due to body weight = $\int_v [N]^T \{b\} dv$

Force vector due to initial stresses = $\int_v [B]^T \{\alpha_0\} dv$

Force vector due to initial strains = $\int_v [B]^T [D] \{\epsilon_0\} dv$

<https://nptel.ac.in/>

Instructor
Dr. K. Rajagopal

And these are all the things that we had derived in the previous class the different integrals that we need to evaluate the first is the stiffness Matrix K is B transpose $D B$ integrated over the volume right and the this Vector of external concentrated forces and the element nodes. So, this is given this we do not need to evaluate and the force vector due to surface traction and this is because of the pressures that are acting on the surface of the element.

$$\text{Stiffness matrix, } [K] = \int_v [B]^T [D] [B] dv$$

vector of external concentrated forces on element nodes = $\{q^e\}$

$$\text{Force vector due to surface traction} = \int_s [N]^T \{t\} ds$$

$$\text{Force vector due to body weight} = \int_v [N]^T \{b\} dv$$

$$\text{Force vector due to initial stresses} = \int_v [B]^T \{\sigma_o\} dv$$

$$\text{Force vector due to initial strains} = \int_v [B]^T [D] \{\epsilon_o\} dv$$

So, this integration is done over the surface and the force Vector due to body weight and transpose B integrated over the volume of the element. And then the force Vector due to initial stresses B transpose Sigma naught and then the force Vector due to initial strains B transpose D Epsilon naught and is actually this is what we do not normally consider in geotechnical engineering because it is not possible to define the initial strains. But we can define the initial stresses because we can do some measurements.

(Refer Slide Time: 02:23)

Force vector due to surface traction = $\int_s [N]^T \{t\} ds$

$$\int_s \begin{bmatrix} N_1 & 0 \\ 0 & N_1 \\ N_2 & 0 \\ 0 & N_2 \\ N_3 & 0 \\ 0 & N_3 \end{bmatrix} \begin{Bmatrix} t_n \\ t_s \end{Bmatrix} ds$$

How to integrate these quantities on the surfaces, especially if they are irregular?

FEA & CM LEARN MORE <https://nptel.ac.in/> Instructor Dr. K. Rajagopal

$$\text{Force vector due to surface traction} = \int_s [N]^T \{t\} ds$$

$$\int_s \begin{bmatrix} N_1 & 0 \\ 0 & N_1 \\ N_2 & 0 \\ 0 & N_2 \\ N_3 & 0 \\ 0 & N_3 \end{bmatrix} \begin{Bmatrix} t_n \\ t_s \end{Bmatrix} ds$$

And the force Vector due to the surface traction is $N^T \{t\}$ ds this is the N and transpose is N^T is N^T $10 \times N^T$ 20 and so on. Now that has 2 rows and 6 columns and then N^T transpose will have 2 columns under 6 rows and the T has the 2 components one is a normal component and the other is a Shear component and by integrating this over the surface we can get the we can get our surface forces but how we can do this that we will see later.

(Refer Slide Time: 03:09)

Force vector due to initial stresses = $\int_v [B]^T \{\sigma_o\} dv$

$$= \int_v \begin{bmatrix} \frac{\partial N_1}{\partial x} & 0 & \frac{\partial N_1}{\partial y} \\ 0 & \frac{\partial N_1}{\partial y} & \frac{\partial N_1}{\partial x} \\ \frac{\partial N_2}{\partial x} & 0 & \frac{\partial N_2}{\partial y} \\ 0 & \frac{\partial N_2}{\partial y} & \frac{\partial N_2}{\partial x} \\ \frac{\partial N_3}{\partial x} & & \frac{\partial N_3}{\partial y} \\ 0 & \frac{\partial N_3}{\partial y} & \frac{\partial N_3}{\partial x} \end{bmatrix} \begin{Bmatrix} \sigma_{x0} \\ \sigma_{y0} \\ \tau_{xy0} \end{Bmatrix} dv$$

FEA & CM LEARN MORE <https://nptel.ac.in/> Instructor Dr. K. Rajagopal

Force vector due to body weight = $\int_v [N]^T \{b\} dv$

$$\int_v \begin{bmatrix} N_1 & 0 \\ 0 & N_1 \\ N_2 & 0 \\ 0 & N_2 \\ N_3 & 0 \\ 0 & N_3 \end{bmatrix} \begin{Bmatrix} b_x \\ b_y \end{Bmatrix} dv$$

And the force Vector due to body weight and transpose B and this is our N^T and our B and these quantities we need to integrate over the volume and then B^T transpose Sigma naught the B is a 3 by 6 Matrix for 3 node triangle and. So, B^T transpose will be 6 by 3 and sigma naught could be Sigma x naught Sigma y naught Tau xy naught and we need to integrate this.

Force vector due to initial stresses = $\int_v [B]^T \{\sigma_o\} dv$

$$= \int_v \begin{bmatrix} \frac{\partial N_1}{\partial x} & 0 & \frac{\partial N_1}{\partial y} \\ 0 & \frac{\partial N_1}{\partial y} & \frac{\partial N_1}{\partial x} \\ \frac{\partial N_2}{\partial x} & 0 & \frac{\partial N_2}{\partial y} \\ 0 & \frac{\partial N_2}{\partial y} & \frac{\partial N_2}{\partial x} \\ \frac{\partial N_3}{\partial x} & 0 & \frac{\partial N_3}{\partial y} \\ 0 & \frac{\partial N_3}{\partial y} & \frac{\partial N_3}{\partial x} \end{bmatrix} \begin{Bmatrix} \sigma_{xo} \\ \sigma_{yo} \\ \tau_{xyo} \end{Bmatrix} dv$$

(Refer Slide Time: 03:57)

Simplest finite element in 2-d is 3-node triangle

- Called as Constant Strain Triangle (CST) as the strains within the element are constant
- Used extensively in the initial days of finite element analysis, especially by aeronautical, space and automobile industry (NASTRAN,)
- Its a simple element and can be easily programmed
- Computations are easy with this element
- Most computations are done by hand and final equations are programmed to save computational effort & time

FEA&CM Lecture-11 3-node CST

FEA & CM LEARN MORE <https://nptel.ac.in/> Instructor
Dr. K. Rajagopal

And the simplest 2 dimensional finite element is 3 node triangle and this is called as the constant strain triangle because the strains within the element are constant. And this particular element the 3 node triangle is extensively used in the initial days of finite element analysis by the aeronautical industry space and automobile industry and one program that was developed by NASTRON was very popular and in fact that has been ported in different languages and by different industry.

And the 3 node triangle became very popular because it is easy to program and the computations are also very easy that we will see in today's lecture. And then most of the computations are done by hand like we do all the product and then give the final thing as we program them the computer so that we can save the computational effort and time like we can do the same thing by computer but then it takes more effort.

Because in those days remember the memory was very small and then the computers were not this fast.

(Refer Slide Time: 05:21)

Pascal Triangle

FEA & CM

LEARN MORE <https://nptel.ac.in/>

Instructor Dr. K. Rajagopal

FEA&CM Lecture-11 3-node CST

And the Pascal triangle we have seen in earlier class that helps us in choosing the polynomial terms. So, that we can have spatial isotropy and if you have a 3 node triangle the 3 terms that we can choose are this constant term 1 and then the linear terms x and y.

(Refer Slide Time: 05:48)

Consider a 3-node triangle with nodes numbered in anti-clockwise direction. Let displacements at any point inside an element be

$$\{u\} = \begin{Bmatrix} u(x,y) \\ v(x,y) \end{Bmatrix}$$

Nodal displacement vector of element is,

$$\{a^{eT}\} = \{u_1 \ v_1 \ u_2 \ v_2 \ u_3 \ v_3\}$$

Displacements at any interior point are,

$$u(x,y) = N_1 u_1 + N_2 u_2 + N_3 u_3$$

$$v(x,y) = N_1 v_1 + N_2 v_2 + N_3 v_3$$

$$\{u\} = [N]\{a^e\} = \begin{Bmatrix} u \\ v \end{Bmatrix} = \begin{bmatrix} N_1 & 0 & N_2 & 0 & N_3 & 0 \\ 0 & N_1 & 0 & N_2 & 0 & N_3 \end{bmatrix} \begin{Bmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \end{Bmatrix}$$

N's are called as shape functions (these are basically interpolation functions)

$$N_i(x_i, y_i) \equiv 1; \quad N_i(x_j, y_j) \equiv 0$$

FEA & CM

LEARN MORE <https://nptel.ac.in/>

Instructor Dr. K. Rajagopal

FEA&CM Lecture-11 3-node CST

Let us look at 3 node triangle with the 3 nodes one 2 and 3 and the displacements \$u_1, v_1, u_2, v_2, u_3, v_3\$ and internal displacement is \$u\$ and the nodal displacement vector is \$u_1, v_1, u_2, v_2, u_3, v_3\$. And the displacements at interior points are \$u\$ and \$v\$ and that we can express as \$N_1 u_1 + N_2 u_2 + N_3 u_3\$ and \$v\$ is \$N_1 v_1 + N_2 v_2 + N_3 v_3\$ and the \$u\$ can be written as \$N\$ times \$a^e\$ where \$N\$ is our shape function Matrix and \$a^e\$ is the vector of nodal displacements.

$$\{u\} = \begin{Bmatrix} u(x, y) \\ v(x, y) \end{Bmatrix}$$

Nodal displacement vector of element is,

$$\{a^{eT}\} = \{u_1 \quad v_1 \quad u_2 \quad v_2 \quad u_3 \quad v_3\}$$

Displacements at any interior point are,

$$u(x, y) = N_1 u_1 + N_2 u_2 + N_3 u_3$$

$$v(x, y) = N_1 v_1 + N_2 v_2 + N_3 v_3$$

$$\{u\} = [N]\{a^e\} = \begin{Bmatrix} u \\ v \end{Bmatrix} = \begin{bmatrix} N_1 & 0 & N_2 & 0 & N_3 & 0 \\ 0 & N_1 & 0 & N_2 & 0 & N_3 \end{bmatrix} \begin{Bmatrix} u_1 \\ v_1 \\ u_2 \\ v_2 \\ u_3 \\ v_3 \end{Bmatrix}$$

And our ends are the shape functions basically these are interpolation functions and some of the attributes we have seen in the previous class.

(Refer Slide Time: 06:51)

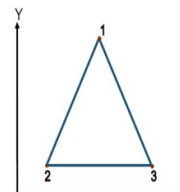

Derivation of shape functions of 3-node CST

Let, $u(x, y) = \alpha_0 + \alpha_1 x + \alpha_2 y$
 Let, $v(x, y) = \alpha_3 + \alpha_4 x + \alpha_5 y$

α 's are called as generalized coordinates.

α_0, α_1 and α_2 can be determined from the known displacements at the nodes, u_1, u_2 and u_3 ; $\alpha_3 = \alpha_0; \alpha_4 = \alpha_1; \alpha_5 = \alpha_2$

$u_1 = \alpha_0 + \alpha_1 x_1 + \alpha_2 y_1$
 $u_2 = \alpha_0 + \alpha_1 x_2 + \alpha_2 y_2$
 $u_3 = \alpha_0 + \alpha_1 x_3 + \alpha_2 y_3$

$$\begin{Bmatrix} u_1 \\ u_2 \\ u_3 \end{Bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix} \begin{Bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \end{Bmatrix} \Rightarrow \begin{Bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \end{Bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix}^{-1} \begin{Bmatrix} u_1 \\ u_2 \\ u_3 \end{Bmatrix}$$

By inverting, α 's are determined in terms of u_1, u_2 & u_3 .

Grouping the terms in terms of u_1, u_2 & u_3 ,

$$u(x, y) = N_1 u_1 + N_2 u_2 + N_3 u_3$$

Nodes are numbered in the anti-clock wise direction

COURSE: FEABCM Lecture-11 3-node CST
 LEARN MORE: <https://nptel.ac.in/>
 Instructor: Dr. K. Rajagopal

And for the 3 node element we can assume a polynomial like this u can be $\alpha_0 + \alpha_1 x + \alpha_2 y$ and v can be $\alpha_3 + \alpha_4 x + \alpha_5 y$ and these α 's are called as generalized coordinates.

$$\text{Let, } u(x, y) = \alpha_0 + \alpha_1 x + \alpha_2 y$$

$$\text{Let, } v(x, y) = \alpha_3 + \alpha_4 x + \alpha_5 y$$

α 's are called as generalized coordinates.

And actually if we derive the values we will see that α_3 is exactly equal to α_0 and α_4 is equal to α_1 α_5 is equal to α_2 because the shape is the same like for both u and v it is the element is the same except you have the u and v terms.

$$\alpha_3 = \alpha_0; \alpha_4 = \alpha_1; \alpha_5 = \alpha_2$$

So, we normally write u as $\alpha_0 + \alpha_1 x + \alpha_2 y$ and use the same function for both the u and v . So, at node one u_1 is $\alpha_0 + \alpha_1 x_1 + \alpha_2 y_1$ and u_2 at node 2 is all u_2 is $\alpha_0 + \alpha_1 x_2 + \alpha_2 y_2$ and at node 3 u_3 is

Alpha naught + alpha 1 x 3 + Alpha 2 y 3 and the matrix form we can write like this u one u 2 u 3 is the Matrix of this coordinates 1 x 1 y 1 1 x 2 y 2 1 x 3 y 3.

$$\begin{aligned}
 u_1 &= \alpha_0 + \alpha_1 x_1 + \alpha_2 y_1 \\
 u_2 &= \alpha_0 + \alpha_1 x_2 + \alpha_2 y_2 \\
 u_3 &= \alpha_0 + \alpha_1 x_3 + \alpha_2 y_3
 \end{aligned}$$

$$\begin{Bmatrix} u_1 \\ u_2 \\ u_3 \end{Bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix} \begin{Bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \end{Bmatrix} \Rightarrow \begin{Bmatrix} \alpha_0 \\ \alpha_1 \\ \alpha_2 \end{Bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix}^{-1} \begin{Bmatrix} u_1 \\ u_2 \\ u_3 \end{Bmatrix}$$

And these are the generalized coordinates Alpha not alpha 1 and Alpha 2 and these Alphas we can get by inverting this Matrix and multiplying with the u 1 u 2 u 3. And so, we can do that and then we can group all the terms under u 1 u 2 and u 3 and then get our internal displacements as N 1 u 1 + N 2 u 2 + N 3 u 3 and if we invert this matrix and group under u 1 u 2 u 3.

$$u(x, y) = N_1 u_1 + N_2 u_2 + N_3 u_3$$

(Refer Slide Time: 09:22)

$N_i = \frac{a_i + b_i x + c_i y}{2\Delta}$
 where, $a_i = x_j y_k - x_k y_j$
 $b_i = y_j - y_k$
 $c_i = x_k - x_j$; i, j, k are cyclic indices varying from 1 to 3

$2\Delta = \text{determinant of the matrix}$
 $= (x_2 y_3 - x_3 y_2) - x_1 (y_3 - y_2) + y_1 (x_3 - x_2)$
 $= (2 \times \text{area of element})$

$a_1 = x_2 y_3 - x_3 y_2$	$a_2 = x_3 y_1 - x_1 y_3$	$a_3 = x_1 y_2 - x_2 y_1$
$b_1 = y_2 - y_3$	$b_2 = y_3 - y_1$	$b_3 = y_1 - y_2$
$c_1 = x_3 - x_2$	$c_2 = x_1 - x_3$	$c_3 = x_2 - x_1$

$\frac{\partial N_i}{\partial x} = \frac{b_i}{2\Delta} \equiv \text{constant}$; $\frac{\partial N_i}{\partial y} = \frac{c_i}{2\Delta} \equiv \text{constant}$

FEA & CM | LEARN MORE <https://nptel.ac.in/> | Instructor Dr. K. Rajagopal

In general we can write the N i as a i + b i x + c i y by 2 Delta where our i is varying from 1 2 3, 1, 2 and 3 and a i is x j y k - y k y j is actually I can vary from 1 2 3 and j also varies from 1 2 3 K is also from 1 2 3 and it actually called as cyclic indices. So, when i is 1 j will be 2 and K will be 3. So, i is 1 2 3 j will be 2 3 1 K will be 3 2 1. And so, if you want a 1 it will be x 2 y 3 - x 3 y 1 and x 3 y 2.

$$N_i = \frac{a_i + b_i x + c_i y}{2\Delta}$$

$$\text{where, } a_i = x_j y_k - x_k y_j$$

$$b_i = y_j - y_k$$

$$c_i = x_k - x_j; \quad i, j, k \text{ are cyclic indices varying from 1 to 3}$$

And then similarly a_2 means $x_3 y_1 - x_1 y_3$. So, b_1 is $y_j - y_k$ c_1 is $x_k - x_j$ and so, our a_1 is $x_2 y_3 - x_3 y_2$ and a_2 is $x_3 y_1 - x_1 y_3$ and a_3 is $x_1 y_2 - x_2 y_1$. So, that is the relation that we have. So, we can see this $a_1 b_1 c_1$; $a_2 b_2 c_2$ and so on. And our derivative of the shape functions will give us our strain. So, if we take a derivative of N_i by x that is b_i by 2Δ and it is not a function of x so, it is constant.

$$\begin{array}{l|l|l} a_1 = x_2 y_3 - x_3 y_2 & a_2 = x_3 y_1 - x_1 y_3 & a_3 = x_1 y_2 - x_2 y_1 \\ b_1 = y_2 - y_3 & b_2 = y_3 - y_1 & b_3 = y_1 - y_2 \\ c_1 = x_3 - x_2 & c_2 = x_1 - x_3 & c_3 = x_2 - x_1 \end{array}$$

$$\frac{\partial N_i}{\partial x} = \frac{b_i}{2\Delta} \equiv \text{constant}; \quad \frac{\partial N_i}{\partial y} = \frac{c_i}{2\Delta} \equiv \text{constant}$$

And derivative of N_i by y is c_i by 2Δ that is also constant it is not a function of x or y . So, it is constant in the space. So, within the element within this 3 node triangle wherever you evaluate you will get the same strain. And this denominator 2Δ is the determinant of the Matrix that coordinate Matrix and if you take the determinant you get $x_2 y_3 - x_3 y_2 - x_1 y_3 + y_1 x_3 - x_2 y_1 + y_2 x_1$.

$$\begin{aligned} 2\Delta &= \text{determinant of the matrix} \\ &= (x_2 y_3 - x_3 y_2) - x_1 (y_3 - y_2) + y_1 (x_3 - x_2) \\ &= (2 \times \text{area of element}) \end{aligned}$$

And this is equal to 2 times the area of the element that we will see with the numerical example a bit later.

(Refer Slide Time: 12:08)

$N_i(x_i, y_i) = 1$
 $N_i(x_j, y_j) = 0$
 $N_1(x, y) + N_2(x, y) + N_3(x, y) \equiv 1$

FEA & CM

FEA&CM Lecture-11 3-node CST

Instructor
Dr. K. Rajagopal

And our N_i is written as $a_i + b_i x + c_i y$ by 2 Delta and our requirement is N_i at $x_i y_i$ should be equal to 1 and you can substitute x_i and y_i in place of x and y and we will see that indeed that the shape function value is 1 and N_i evaluated at some other node $x_j y_j$ will be 0 and the sum total of all the 3 shape functions $N_1 + N_2 + N_3$ is equal to one.

$$\begin{aligned}
 N_i(x_i, y_i) &= 1 \\
 N_i(x_j, y_j) &= 0 \\
 N_1(x, y) + N_2(x, y) + N_3(x, y) &\equiv 1
 \end{aligned}$$

(Refer Slide Time: 12:54)

Determinant of coordinate matrix (clockwise numbering)

$X_1 = 0, Y_1 = 8$
 $X_2 = 10, Y_2 = 0$
 $X_3 = 0, Y_3 = 0$

Area of the triangle = $\frac{1}{2} \times 10 \times 8 = 40$

Determinant of the coordinate matrix,

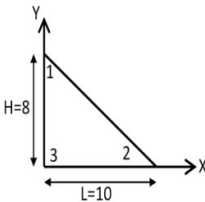

$$\begin{vmatrix} 1 & 0 & 8 \\ 1 & 10 & 0 \\ 1 & 0 & 0 \end{vmatrix} = 1 \times (0 - 10 \times 8) = -80$$

If nodes are numbered in clock-wise direction, there is an additional computation to make the determinant as +ve which adds to the computational time!!!

FEA & CM

FEA&CM Lecture-11 3-node CST

Instructor
Dr. K. Rajagopal

And let us determine the determinant of that coordinate matrix let us take a simple right angle triangle 1 2 3 length of 10 and the height of 8. and let us give some coordinate values.

Now let us take Node 1 at origin $x_1 = y_1 = 0$ and $x_2 = 10$ $y_2 = 0$ and $x_3 = 0$ $y_3 = 8$. And so the area of this triangle is half the base times height that is equal to 40. And the determinant of this coordinate Matrix $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$, $x_1 = y_1 = 0$ $x_2 = 10$ and $y_2 = 0$ $x_3 = 0$ and $y_3 = 8$.

$$\begin{aligned} X_1 &= Y_1 = 0 \\ X_2 &= 10, Y_2 = 0 \\ X_3 &= 0, Y_3 = 8 \end{aligned}$$

$$\text{Area of the triangle} = \frac{1}{2} \times 10 \times 8 = 40$$

Determinant of the coordinate matrix,

$$\begin{vmatrix} 1 & 0 & 0 \\ 1 & 10 & 0 \\ 1 & 0 & 8 \end{vmatrix} = 10 \times 8 = 80 = 2 \times \text{area of triangle}$$

So, this is the determinant that is 80. that is equal to twice the area of the triangle and this is with anti-clockwise numbering that is node 1 node 2 node 3 this is called as anti-clockwise we are going from x to y in the anti-clockwise direction

and let us consider what happens if you have a clockwise numbering 1 2 and 3. So our $x_1 = 0$ $y_1 = 8$ $x_2 = 10$ $y_2 = 0$ and node 3 is at origin $x_3 = y_3 = 0$ and the determinant of the coordinate Matrix $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$ that comes to -80.

$$\begin{aligned} X_1 &= 0, Y_1 = 8 \\ X_2 &= 10, Y_2 = 0 \\ X_3 &= 0, Y_3 = 0 \end{aligned}$$

$$\text{Area of the triangle} = \frac{1}{2} \times 10 \times 8 = 40$$

Determinant of the coordinate matrix,

$$\begin{vmatrix} 1 & 0 & 8 \\ 1 & 10 & 0 \\ 1 & 0 & 0 \end{vmatrix} = 1 \times (0 - 10 \times 8) = -80$$

Previously we had 80 + 80 for anti-clockwise numbering but when we numbered the nodes in the clockwise manner we get a negative value and the determinant is actually related to the area of the element. So, we want a positive value because obviously our area cannot be negative. So, if the nodes are numbered in the anti-clockwise direction automatically the determinant we see is a positive quantity.

But if we number the nodes in the clockwise direction we get a negative value and to make it as a positive value then we need to write it as minus- of the determinant that is minus of minus 80 will be plus 80 and that adds an additional computation which adds to the time and because we may be having millions of elements in our mesh. And so to come to save the time up front we can number the nodes in the anti-clockwise direction rather than the clockwise direction so, that we can at least save that much time.

(Refer Slide Time: 16:00)

B-matrix for plane stress and plane strain element is,

$$B = \begin{bmatrix} \frac{\partial N_1}{\partial x} & 0 & \frac{\partial N_2}{\partial x} & 0 & \frac{\partial N_3}{\partial x} & 0 \\ 0 & \frac{\partial N_1}{\partial y} & 0 & \frac{\partial N_2}{\partial y} & 0 & \frac{\partial N_3}{\partial y} \\ \frac{\partial N_1}{\partial y} & \frac{\partial N_1}{\partial x} & \frac{\partial N_2}{\partial y} & \frac{\partial N_2}{\partial x} & \frac{\partial N_3}{\partial y} & \frac{\partial N_3}{\partial x} \end{bmatrix} = \frac{1}{2\Delta} \begin{bmatrix} b_1 & 0 & b_2 & 0 & b_3 & 0 \\ 0 & c_1 & 0 & c_2 & 0 & c_3 \\ c_1 & b_1 & c_2 & b_2 & c_3 & b_3 \end{bmatrix}$$

All terms in the B-matrix are constant. Hence, all strains within the element are constant.

Stiffness matrix, $K = \int_V [B]^T [D] [B] dv$;

[B] is a constant matrix; [D] is constant for homogeneous material

$[K] = [B]^T [D] [B] \times \int_V dv = [B]^T [D] [B] \times \text{volume of element}$

Volume of plane stress element = Area of element x thickness of element

Volume of plane strain element = Area of element x unit thickness (1)

Area of element = determinant/2

FEA & CM LEARN MORE <https://nptel.ac.in/> Instructor Dr. K. Rajagopal

So, the B Matrix for the plane stress and plane strain elements for the 3 node triangle will be like this 3 rows corresponding to 3 strains and the 6 columns corresponding to 6 degrees of

freedom and our $\frac{dN}{dx}$ is $\frac{b_i}{2\Delta}$ and $\frac{dN}{dy}$ is $\frac{c_i}{2\Delta}$. So, our B is one by 2Δ B 10 B 20 and so on. And the B and the C they are absolute constants. So, our all the terms within the B Matrix are constant.

B-matrix for plane stress and plane strain element is,

$$B = \begin{bmatrix} \frac{\partial N_1}{\partial x} & 0 & \frac{\partial N_2}{\partial x} & 0 & \frac{\partial N_3}{\partial x} & 0 \\ 0 & \frac{\partial N_1}{\partial y} & 0 & \frac{\partial N_2}{\partial y} & 0 & \frac{\partial N_3}{\partial y} \\ \frac{\partial N_1}{\partial y} & \frac{\partial N_1}{\partial x} & \frac{\partial N_2}{\partial y} & \frac{\partial N_2}{\partial x} & \frac{\partial N_3}{\partial y} & \frac{\partial N_3}{\partial x} \end{bmatrix} = \frac{1}{2\Delta} \begin{bmatrix} b_1 & 0 & b_2 & 0 & b_3 & 0 \\ 0 & c_1 & 0 & c_2 & 0 & c_3 \\ c_1 & b_1 & c_2 & b_2 & c_3 & b_3 \end{bmatrix}$$

All terms in the B-matrix are constant. Hence, all strains within the element are constant.

Stiffness matrix, $K = \int_v [B]^T [D] [B] dv$;

[B] is a constant matrix; [D] is constant for homogeneous material

[K] = $[B]^T [D] [B] \times \int_v dv = [B]^T [D] [B] \times \text{volume of element}$

Volume of plane stress element = Area of element x thickness of element

Volume of plane strain element = Area of element x unit thickness (1)

So, the strain is also constant and our equation for the stiffness Matrix K is integral B transpose D B and our B is constant and if we assume homogeneous material D is also constant. So, we can bring out the B transpose D B out of the integral and write K as integral of B sorry B transpose D B multiplied by integral dv. And this is equal to volume of the element and the volume of the element is area of the element that is the determinant divided by 2 multiplied by thickness.

See for the plane stress there is a thickness and for a plane strain it is a unit value. So, for the plane stress case the volume is area of the element multiplied by thickness of the element and volume of the plane strain element is area of the element multiplied by 1 and the area of the element itself is determinant divided by 2.

Nodal forces due to body weight: $\int_v [N]^T \{b\} dv$

- Weight of the body is volume \times unit weight
- Volume = area \times thickness (area = determinant/2)
- Body forces are divided between the three nodes equally without going through the calculations as the three nodes have equal influence

FEA & CM LEARN MORE <https://nptel.ac.in/> Instructor Dr. K. Rajagopal

FEA&CM Lecture-11 3-node CST

So, our nodal Force Vector N transpose B the total weight of the body is volume multiplied by unit weight and the volume is the area multiplied by thickness and the body force is distributed equally between the 3 nodes for a 3 node triangle. We do not need to really go through the calculation of this N transpose B because even if you do we will get the same thing and because each node has an equal distribution or equal influence on the stiffness of the system. So, our body force is divided equally between the 3 nodes.

$$\text{Nodal forces due to body weight: } \int_v [N]^T \{b\} dv$$

And the nodal Force Vector due to the initial stresses B transpose σ naught and the B and σ naught are constant.

$$\text{Nodal forces due to initial stresses: } \int_v [B]^T \{\sigma_o\} dv$$

- As $[B]$ and $\{\sigma\}$ are constant over the element, their product can be evaluated without any integration

So, our we do not really need to do the integral we can bring out B transpose σ naught outside the integral and we will see integral dv or the volume that is equal to volume of the element once again it is a very simple calculation B is B transpose is 6 by 3 and σ naught is having a length of 3. So, 6 by 3 multiplied by 3 by 1 is 6 by 1. So, you get a vector of length 6 for the initial stresses.

3-node axisymmetric triangular element

Four strains are present in axisymmetric elements, $\{\epsilon\}^T = \{\epsilon_{rr}, \epsilon_{zz}, \gamma_{rz}, \epsilon_\theta\}$

B-matrix for axisymmetric element,

$$B = \begin{bmatrix} b_1/2\Delta & 0 & b_2/2\Delta & 0 & b_3/2\Delta & 0 \\ 0 & c_1/2\Delta & 0 & c_2/2\Delta & 0 & c_3/2\Delta \\ c_1/2\Delta & b_1/2\Delta & c_2/2\Delta & b_2/2\Delta & c_3/2\Delta & b_3/2\Delta \\ \frac{N_1}{r} & 0 & \frac{N_2}{r} & 0 & \frac{N_3}{r} & 0 \end{bmatrix}$$

$$N_i = \frac{a_i + b_i r + c_i z}{2\Delta}$$

First three rows are constant; only the last row varies over the element due to r & z terms.

Instructor
Dr. K. Rajagopal

B-matrix for axisymmetric element,

$$B = \begin{bmatrix} b_1/2\Delta & 0 & b_2/2\Delta & 0 & b_3/2\Delta & 0 \\ 0 & c_1/2\Delta & 0 & c_2/2\Delta & 0 & c_3/2\Delta \\ c_1/2\Delta & b_1/2\Delta & c_2/2\Delta & b_2/2\Delta & c_3/2\Delta & b_3/2\Delta \\ \frac{N_1}{r} & 0 & \frac{N_2}{r} & 0 & \frac{N_3}{r} & 0 \end{bmatrix}$$

And so let us see for axis symmetric triangular elements we have four strain components and so, the B Matrix for the axis symmetric elements will be like this the first 3 rows are familiar B by 2 Delta 0 and so on 0 by C by 2 Delta and the third row C by 2 Delta and B by 2 Delta and the fourth row is corresponding to Epsilon Theta that is N by r k N 1 by r 0 and 2 by r 0 and 3 by r zero and our N i is a i + b i r + c i z by 2 Delta.

$$N_i = \frac{a_i + b_i r + c_i z}{2\Delta}$$

And the first 3 rows are constants as we have seen with the plane stress and plane strain only the last row is not constant because of our r and z .

(Refer Slide Time: 20:32)

The N_i are evaluated at the centroid of the element by replacing r and z as

$$\bar{r} = \frac{r_1+r_2+r_3}{3} ; \quad \bar{z} = \frac{z_1+z_2+z_3}{3}$$

N_i & $[B]$ are assumed to be constant over the element

B-matrix evaluated at the centroid of the element is \bar{B}

$$[K] = [\bar{B}]^T [D] [\bar{B}] \times \int_v dv = [\bar{B}]^T [D] [\bar{B}] \times \text{volume of element}$$

$$= [\bar{B}]^T [D] [\bar{B}] \times 2\pi\bar{r} \times \text{Area of element}$$

In the early days of FEA, the terms in the $[6 \times 6]$ stiffness matrix were evaluated manually and programmed to reduce the work load on the computers !!!!!

FEARCM Lecture-11 3-node CST

COURSE **FEA & CM** LEARN MORE <https://nptel.ac.in/> Instructor **Dr. K. Rajagopal**

The N_i are evaluated at the centroid of the element by replacing r and z as

$$\bar{r} = \frac{r_1+r_2+r_3}{3} ; \quad \bar{z} = \frac{z_1+z_2+z_3}{3}$$

And we can make an approximation that we are going to evaluate the fourth row of the centroid of the element \bar{r} and \bar{z} \bar{r} is $r_1 + r_2 + r_3$ by 3 and \bar{z} is $z_1 + z_2 + z_3$ by 3 and our N and B now can be treated as constant and we can evaluate the B Matrix at the centroid of the element \bar{B} . And our K is a \bar{B} transpose D times \bar{B} multiplied by volume of the element.

B-matrix evaluated at the centroid of the element is \bar{B}

$$[K] = [\bar{B}]^T [D] [\bar{B}] \times \int_v dv = [\bar{B}]^T [D] [\bar{B}] \times \text{volume of element}$$

$$= [\bar{B}]^T [D] [\bar{B}] \times 2\pi\bar{r} \times \text{Area of element}$$

And the volume of the element is a $2\pi\bar{r}$ times area of the element \bar{r} is the average radius and $2\pi\bar{r}$ multiplied by area of the element is volume of the element and that I will illustrate the next slide. And so, in the early finite element programs see this entire 6×6 Matrix the programmers used to do multiplication by hand and then give all these 36 terms directly into the computer program so, that we can reduce the load on the work on the computer.

Because that was how the programs used to be developed but now we do not do that because the computers have huge memory and they are also very powerful.

(Refer Slide Time: 22:10)

Volume of the cylinder of height H & radius r
 $= \pi r^2 H$

By rotating the rectangle around the symmetry axis
 by $360^\circ = 2\pi$, volume of cylinder can be estimated

H Volume = area of rectangle \times average circumference
 $= H \cdot r \cdot (2 \cdot \pi \cdot r / 2) = \pi r^2 H$

FEA & CM
 LEARN MORE <https://nptel.ac.in/>
 Instructor
 Dr. K. Rajagopal

So, let us see what exactly we mean by the volume see we have this cylinder having a radius of r and the height of h . So, the volume of the cylinder is $\pi r^2 h$ that is the area of the circle multiplied by H . And we can get the cylinder by rotating a rectangle of radius r rotating around this symmetric axis and rotating full circle by 360 degrees that is equal to 2π and by sweeping this around we can get the volume as area of the rectangle that is H multiplied by r is what we are seeing on the on the computer screen.

Volume of the cylinder of height H & radius r
 $= \pi r^2 H$

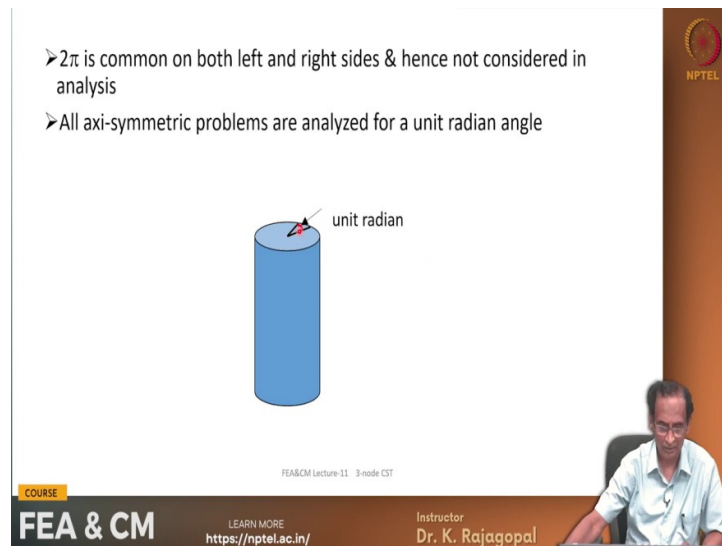

By rotating the rectangle around the symmetry axis
 by $360^\circ = 2\pi$, volume of cylinder can be estimated

H Volume = area of rectangle \times average circumference
 $= H \cdot r \cdot (2 \cdot \pi \cdot r / 2) = \pi r^2 H$

That is the area of the rectangle multiplied by average circumference that is a $2\pi r$ by 2 that is equal to $\pi r^2 H$ that is the same as the volume of the cylinder. So, when we did this calculation that is what we have done $2\pi r$ Bar that is r Bar is the average radius and $2\pi r$

bar is the average circumference multiplied by the area of the element that will give you the volume of the element.

(Refer Slide Time: 23:38)

Slide content for 23:38:

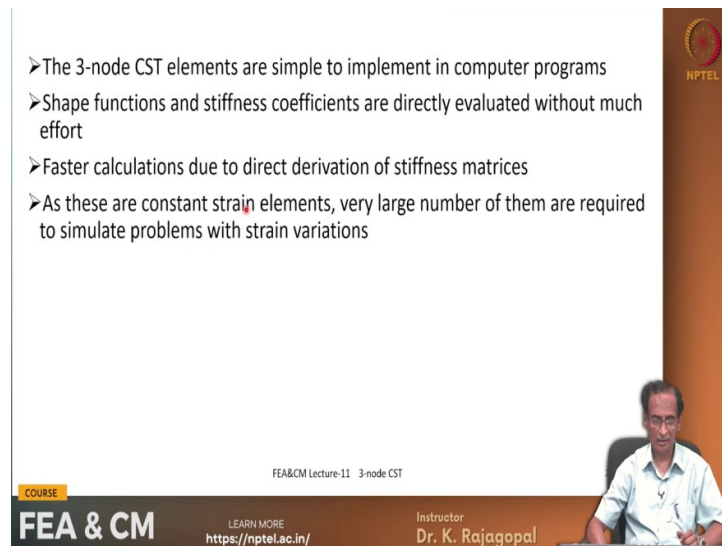

- 2π is common on both left and right sides & hence not considered in analysis
- All axis-symmetric problems are analyzed for a unit radian angle

Diagram: A blue cylinder representing a 3-node CST element. A red arrow indicates a unit radian angle at the top surface. The text "unit radian" is next to the arrow.

FEA & CM | LEARN MORE <https://nptel.ac.in/> | Instructor Dr. K. Rajagopal

And we do all these calculations for a unit radian because our 2π is common and both the left hand side and the right hand side we have this 2π in the stiffness term and also and all the load terms. And so, we can we remove the 2π on the left hand side and the right hand side and do the calculations for a unit radian say all our calculations for the axis symmetric case they are done for a unit radian not for the full circle 2π but we do only for the the this $r\theta$ where θ is one.

Slide content for 24:24:

- The 3-node CST elements are simple to implement in computer programs
- Shape functions and stiffness coefficients are directly evaluated without much effort
- Faster calculations due to direct derivation of stiffness matrices
- As these are constant strain elements, very large number of them are required to simulate problems with strain variations

FEA & CM | LEARN MORE <https://nptel.ac.in/> | Instructor Dr. K. Rajagopal

And this 3 node CST are the constant strain triangle that simple to implement in computer programs the shape functions and the stiffness coefficients are directly evaluated without

much effort. And faster calculations due to direct derivation of the stiffness matrices and but only limitation is as the strain is constant within the element we require very large number of elements to simulate any problem with the strain variation.

Most of the problems there will be a gradient at the strain and if you want to represent that accurately we need very very large number of CST's constant strain triangles. So, that is a brief introduction on how we can do the computations with the 3 node triangle and if you have any questions please send an email to this address profkkr@gmail.com. So, thank you very much.
