(Refer Slide Time: 00:18)

Hello everyone, today we will solve numerical problems based on Rectangular Waveguide. So, our first problem states that, a rectangular waveguide with dimension  $a$  equals to 2.5 centimeter,  $b$  equals 1 centimeter is to operate below 15.1 Gig Hertz. How many TE and TM modes can the waveguide transmit if the guide is filled with a medium characterize by  $\sigma$  equals to 0,  $\epsilon$  equals to 4,  $\epsilon_0$  and  $\mu_r$  are equals to 1. Calculate the cut-off frequencies of the modes.

(Refer Slide Time: 00:55)

The cut off frequency is given by:

$$f_{c_{mn}} = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Given  $a = 2.5 \text{ cm}$  ;  $b = 1 \text{ cm} \Rightarrow \frac{a}{b} = 2.5$

$$u' = \frac{1}{\sqrt{\epsilon \mu}} = \frac{c}{\sqrt{\mu_r \epsilon_r}} = \frac{c}{2}$$
$$f_{c_{mn}} = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Given  $a = 2.5 \text{ cm}$  ;  $b = 1 \text{ cm} \Rightarrow \frac{a}{b} = 2.5$

$$u' = \frac{1}{\sqrt{\epsilon \mu}} = \frac{c}{\sqrt{\mu_r \epsilon_r}} = \frac{c}{2}$$

Hence,

$$f_{c_{mn}} = \frac{c}{4} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Hence,

$$f_{c_{mn}} = \frac{c}{4} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$
$$= \frac{c}{4a} \sqrt{m^2 + \frac{n^2 a^2}{b^2}}$$
$$= \frac{c}{4a} \sqrt{m^2 + n^2 (2.5)^2}$$
$$= \frac{3 \times 10^8}{4 \times 2.5 \times 10^{-2}} \sqrt{m^2 + 6.25 n^2}$$
$$= 3 \sqrt{m^2 + 6.25 n^2} \text{ GHz}$$

So, to start with we know, the cut-off frequency is given by

$$f_{c_{mn}} = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Where, m and n are the indices for the modes.

So, we had given that a is 2.5 centimeter and b is 1 centimeter. So, we can write

$$f_{c_{mn}} = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Given  $a = 2.5 \text{ cm}$  ;  $b = 1 \text{ cm} \Rightarrow \frac{a}{b} = 2.5$

$$u' = \frac{1}{\sqrt{\epsilon \mu}} = \frac{c}{\sqrt{\mu_r \epsilon_r}} = \frac{c}{2}$$

Hence,

$$f_{c_{mn}} = \frac{c}{4} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$

Now, substituting the values we will get

Hence,

$$f_{c_{mn}} = \frac{c}{4} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$
$$= \frac{c}{4a} \sqrt{m^2 + n^2 \frac{a^2}{b^2}}$$
$$= \frac{c}{4a} \sqrt{m^2 + n^2 (2.5)^2}$$
$$= \frac{3 \times 10^8}{4 \times 2.5 \times 10^{-2}} \sqrt{m^2 + 6.25 n^2}$$
$$= 3 \sqrt{m^2 + 6.25 n^2} \text{ GHz}$$

(Refer Slide Time: 05:37)

$$f_c = 3 \sqrt{m^2 + 6.25n^2} \quad \text{--- (1)}$$

Needed  $f_{c_{mn}} < 15.1 \text{ GHz}$

$(m=0, n=1)$   $TE_{01}$  mode  $\rightarrow f_{c_{01}} = 7.5 \text{ GHz}$

$(m=0, n=2)$   $TE_{02}$  mode  $\rightarrow f_{c_{02}} = 15 \text{ GHz}$

$(m=0, n=3)$   $f_{c_{03}} = 22.5 \text{ GHz}$

Needed  $f_{c_{mn}} < 15.1 \text{ GHz}$

$(m=0, n=1)$   $TE_{01}$  mode  $\rightarrow f_{c_{01}} = 7.5 \text{ GHz}$

$(m=0, n=2)$   $TE_{02}$  mode  $\rightarrow f_{c_{02}} = 15 \text{ GHz}$

$(m=0, n=3)$   $f_{c_{03}} = 22.5 \text{ GHz}$

Thus, max 'n' is 2.

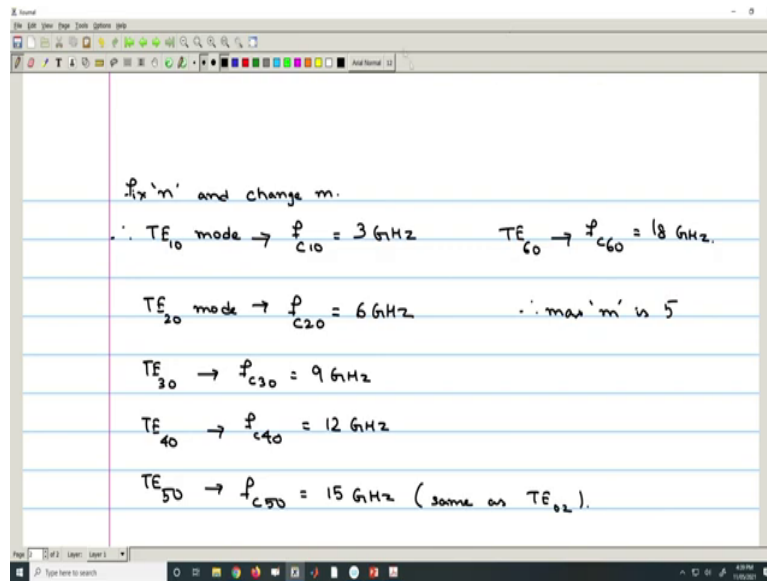

here it is given that, we need to operate the waveguide below 15.1 Giga Hertz. So, it is needed to be that  $f_{c_{mn}}$  should be less than 15.1 Giga Hertz. Now, a systematic way of doing this is to fix m or n and then increase the other until  $f_{c_{mn}}$  is greater than 15.1 Giga Hertz.

So, what we will do, we will first fix m and then we will fix n so, first fixing m we get like for m equals to 0 and n equals to 1 suppose, we are getting  $TE_{01}$  for  $TE_{01}$  mode we will get the cut-off frequency as  $f_{c_{01}}$ . So, from equation number 1 we will substitute the values of indices m and n in equation 1, and then it will yield us  $f_{c_{01}}$  as 7.5 Giga Hertz.

So, in equation 1, we are substituting first  $m=0$  and  $n=1$  and therefore for  $TE_{01}$  mode we are getting  $f_{c_{01}}$  as 7.5 Giga Hertz. So, we are now fixing m so, now the next will be m is 0 n is 2 therefore, for  $TE_{02}$  mode we will get  $f_{c_{02}}$  as 15 Giga Hertz. Similarly, for  $m=0$   $n=3$  we

will get  $f$ , we will get  $f \approx 22.5$  Giga Hertz. So, 22.5 is coming greater than 15.1 so, we can say that maximum  $n$  can be 2 so, to conclude we can say thus, maximum  $n$  is 2.

(Refer Slide Time: 08:59)

Now, now what will do? We will now fix n and then change m so, now we will, now we will fix n and change m therefore, for  $TE_{10}$  mode we will have f of  $c_{10}$  as 3 Giga Hertz again this we are getting from equation number 1, for the indices  $m=1$  and  $n=0$ . So, now we will again change the next value. That is for  $TE_{20}$  so, for  $TE_{20}$  mode f will be f of  $c_{20}$  that is 6 Giga Hertz similarly we can find out, for  $TE_{30}$  we will have 9 Giga Hertz, for  $TE_{40}$  we will have 12 Giga Hertz,  $TE_{50}$  we will have 15 Giga Hertz and then for  $TE_{60}$  we will have 18 Giga Hertz.

Now, this  $TE_{50}$  where  $f_{c50}$  is 15 Giga Hertz this is same as  $TE_{02}$  therefore from above we can conclude that maximum m is 5 because, 18 Giga Hertz is again greater than 15.1. Now, what we know that, we know the maximum m and n now, we will try the other possible combinations in between these maximum values. So, since we know the maximum value of m is 5 and n is 2 we will try some other possible conditions in between these maximum values.

(Refer Slide Time: 11:46)

The image shows a digital whiteboard with the following handwritten text:

$$TE_{11}, TM_{11} \text{ (degenerate)} f_{c11} = 8.08 \text{ GHz}$$
$$TE_{21}, TM_{21} \rightarrow f_{c21} = 9.6 \text{ GHz}$$
$$TE_{31}, TM_{31} \rightarrow f_{c31} = 11.72 \text{ GHz}$$
$$TE_{41}, TM_{41} \rightarrow f_{c41} = 14.14 \text{ GHz}$$
$$TE_{12}, TM_{12} \rightarrow f_{c12} = 15.3 \text{ GHz}$$

11 TE, 4 TM

So, we will have

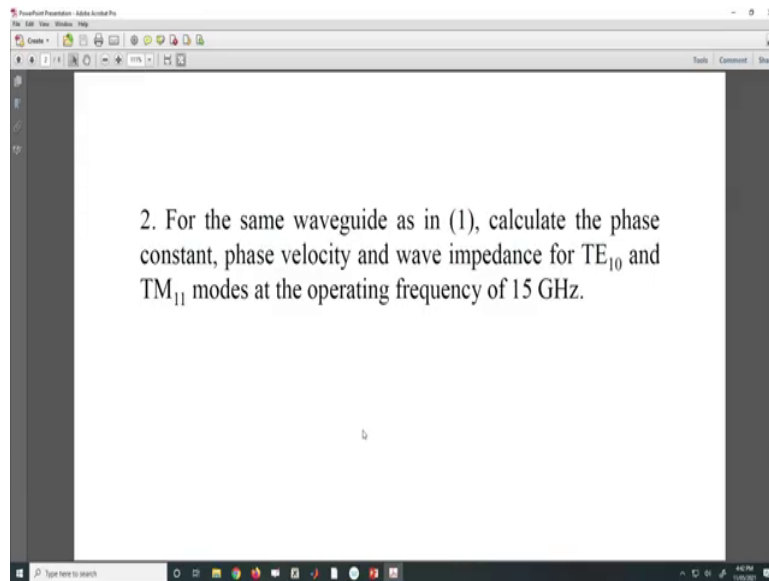

The image shows handwritten notes on a whiteboard, identical to the screenshot above:

$$TE_{11}, TM_{11} \text{ (degenerate)} f_{c11} = 8.08 \text{ GHz}$$
$$TE_{21}, TM_{21} \rightarrow f_{c21} = 9.6 \text{ GHz}$$
$$TE_{31}, TM_{31} \rightarrow f_{c31} = 11.72 \text{ GHz}$$
$$TE_{41}, TM_{41} \rightarrow f_{c41} = 14.14 \text{ GHz}$$
$$TE_{12}, TM_{12} \rightarrow f_{c12} = 15.3 \text{ GHz}$$

11 TE, 4 TM

So, now those modes whose cut-off frequency is less than or equal to 15.1 Gig Hertz, will be transmitted so, among all the possible conditions we will see, we can see that 11 TE and 4 TM modes are possible, so, the next problem.

(Refer Slide Time: 13:37)

So, for this same waveguide as an question 1, we need to calculate the phase constant, phase velocity and wave impedance for TE<sub>10</sub> and TM<sub>11</sub> modes at the operating frequency of 15 Giga Hertz.

(Refer Slide Time: 14:04)

2.  $f_c = 3 \sqrt{m^2 + 6.25n^2}$   $f = 15 \text{ GHz}$

TE<sub>10</sub>  $\rightarrow f_c = 3 \text{ GHz}$

Phase constant  $\beta = \omega \sqrt{\mu \epsilon} \sqrt{1 - \left(\frac{f_c}{f}\right)^2}$

$= 2\pi f \sqrt{\mu_0 \epsilon_0 \mu_r \epsilon_r} \sqrt{1 - \left(\frac{f_c}{f}\right)^2}$

$= \frac{2\pi f}{c} \times 2 \times \sqrt{1 - \left(\frac{3}{15}\right)^2} = 615.62 \text{ rad/m}$

Now, first we need to calculate phase constant so, phase constant is given by,

$$f_c = 3 \sqrt{m^2 + 6.25n^2} \quad f = 15 \text{ GHz}$$

$$TE_{10} \rightarrow f_c = 3 \text{ GHz}$$

$$\text{Phase constant } \beta = \omega \sqrt{\mu \epsilon} \sqrt{1 - \left(\frac{f_c}{f}\right)^2}$$

$$= 2\pi f \sqrt{\mu_0 \epsilon_0 \mu_r \epsilon_r} \sqrt{1 - \left(\frac{f_c}{f}\right)^2}$$

$$= \frac{2\pi f}{c} \times 2 \times \sqrt{1 - \left(\frac{3}{15}\right)^2} = 615.62 \text{ rad/m}$$

So, substituting the values will give us 615.62 Rad per meter.

(Refer Slide Time: 16:35)

The image shows a screenshot of a digital whiteboard with handwritten mathematical derivations. The first derivation calculates the phase velocity as  $\frac{\omega}{\beta} = \frac{2\pi \times 15 \times 10^9}{615.62} = 1.53 \times 10^8 \text{ m/s}$ . The second derivation calculates the wave impedance as  $\sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - (\frac{\beta}{\omega})^2}} = 192.4 \Omega$ .

$$\text{phase velocity} = \frac{\omega}{\beta} = \frac{2\pi \times 15 \times 10^9}{615.62}$$
$$= 1.53 \times 10^8 \text{ m/s.}$$
$$\text{wave impedance} = \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - \left(\frac{\beta}{\omega}\right)^2}}$$
$$= \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - \left(\frac{3}{15}\right)^2}} = 192.4 \Omega$$

Next is phase velocity :

This block contains a second set of handwritten mathematical derivations, identical to the ones in the screenshot above. It shows the calculation of phase velocity as  $\frac{\omega}{\beta} = \frac{2\pi \times 15 \times 10^9}{615.62} = 1.53 \times 10^8 \text{ m/s}$  and the wave impedance as  $\sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - (\frac{\beta}{\omega})^2}} = 192.4 \Omega$ .

$$\text{phase velocity} = \frac{\omega}{\beta} = \frac{2\pi \times 15 \times 10^9}{615.62}$$
$$= 1.53 \times 10^8 \text{ m/s.}$$
$$\text{wave impedance} = \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - \left(\frac{\beta}{\omega}\right)^2}}$$
$$= \sqrt{\frac{\mu_0}{\epsilon_0}} \frac{1}{\sqrt{1 - \left(\frac{3}{15}\right)^2}} = 192.4 \Omega.$$

similar thing we need to repeat for TM 11.

(Refer Slide Time: 18:26)

$$\begin{aligned}
 \text{TM}_{11} \rightarrow f_c &= \frac{1}{2\sqrt{4\epsilon_0\mu_0}} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}} \\
 &= \frac{c}{4} \sqrt{\frac{1}{(2.5 \times 10^{-2})^2} + \frac{1}{(1 \times 10^{-2})^2}} \\
 &= 8.07 \text{ GHz.} \\
 \text{phase constant } \beta &= \frac{4\pi f}{c} \sqrt{1 - \left(\frac{8.07}{15}\right)^2} = 529.4 \text{ rad/m} \\
 \text{phase velocity } \rightarrow \frac{\omega}{\beta} &= 1.78 \times 10^8 \text{ m/s}
 \end{aligned}$$

So, for TM 11,

$$\begin{aligned}
 \text{TM}_{11} \rightarrow f_c &= \frac{1}{2\sqrt{4\epsilon_0\mu_0}} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}} \\
 &= \frac{c}{4} \sqrt{\frac{1}{(2.5 \times 10^{-2})^2} + \frac{1}{(1 \times 10^{-2})^2}} \\
 &= 8.07 \text{ GHz.} \\
 \text{phase constant } \beta &= \frac{4\pi f}{c} \sqrt{1 - \left(\frac{8.07}{15}\right)^2} = 529.4 \text{ rad/m} \\
 \text{phase velocity } \rightarrow \frac{\omega}{\beta} &= 1.78 \times 10^8 \text{ m/s.}
 \end{aligned}$$

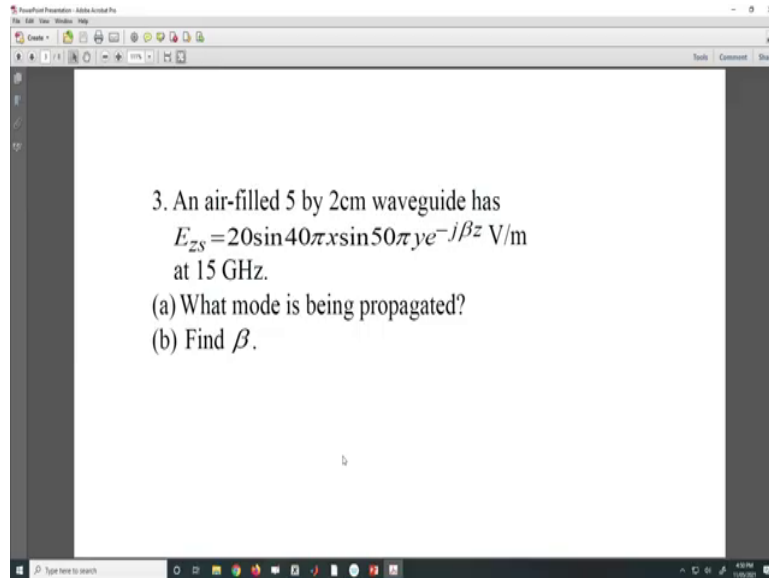

(Refer Slide Time: 21:02)

$$\text{wave impedance} \rightarrow \sqrt{\frac{\mu}{\epsilon}} \sqrt{1 - \left(\frac{f_c}{f}\right)^2} = 158.8 \Omega$$

substituting we will get 158.8 Ohm.

Now, the next question.

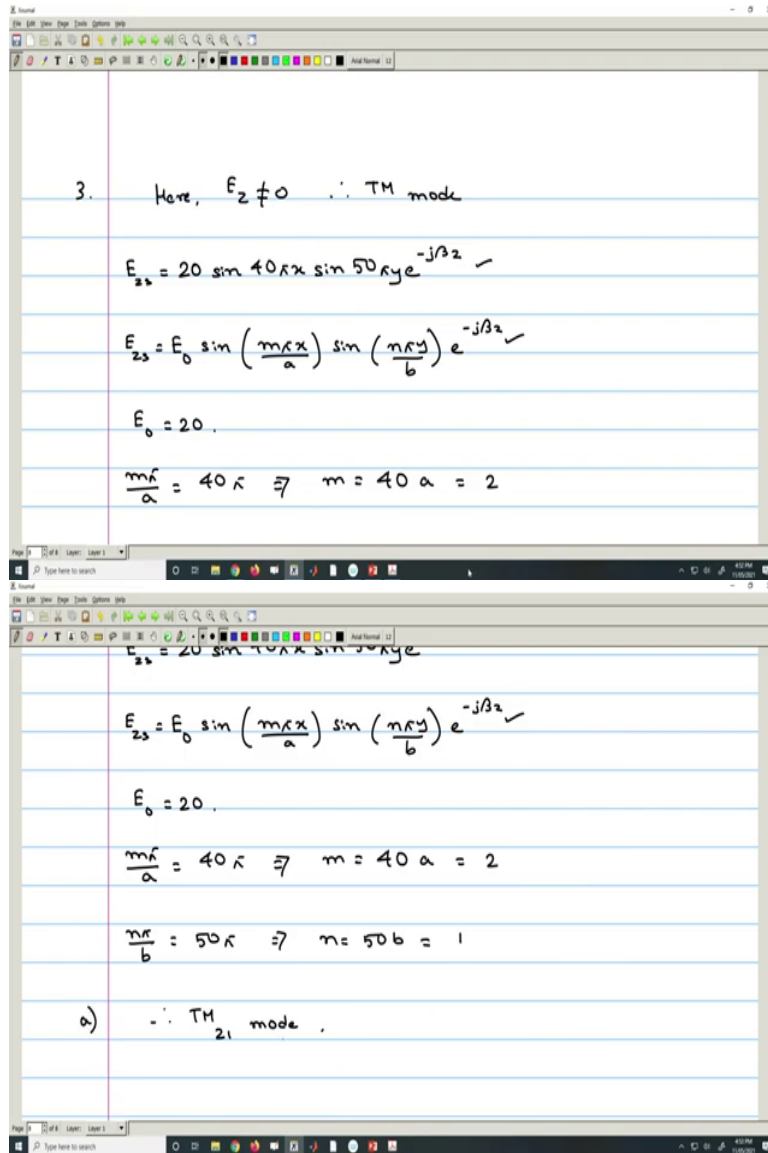

(Refer Slide Time: 21:34)

The third question says

3. An air-filled 5 by 2cm waveguide has  
 $E_{zs} = 20 \sin 40\pi x \sin 50\pi y e^{-j\beta z}$  V/m  
at 15 GHz.  
(a) What mode is being propagated?  
(b) Find  $\beta$ .

(Refer Slide Time: 22:10)

So, here  $E_z$  is nonzero therefore, it is a TM mode now,

Here,  $E_z \neq 0 \therefore$  TM mode

$$E_{zs} = 20 \sin 40\pi x \sin 50\pi y e^{-j\beta z}$$

$$E_{zs} = E_0 \sin\left(\frac{m\pi x}{a}\right) \sin\left(\frac{n\pi y}{b}\right) e^{-j\beta z}$$

$$E_0 = 20$$

$$\frac{m\pi}{a} = 40\pi \Rightarrow m = 40a = 2$$

m comes out as 2.

And again, comparing the above two equations we get n as 1. Therefore, the indices are 2 and 1 so, TM<sub>21</sub> mode is being propagated.

(Refer Slide Time: 25:03)

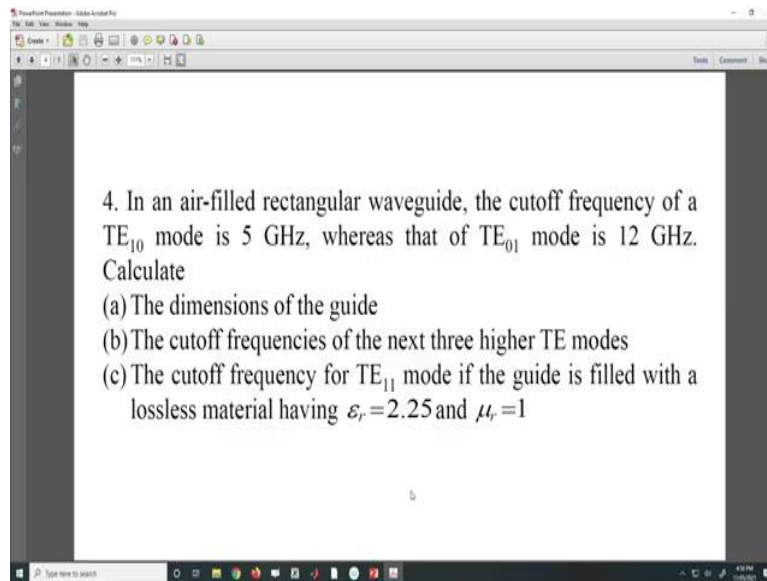

$$\begin{aligned}
 \text{b) } \beta &= \omega \sqrt{\mu \epsilon} \sqrt{1 - \left(\frac{f_c}{f}\right)^2} \\
 f_c &= \frac{1}{2 \sqrt{\mu \epsilon}} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \\
 &= \frac{3 \times 10^8}{2} \sqrt{\left(\frac{2}{5 \times 10^{-2}}\right)^2 + \left(\frac{1}{2 \times 10^{-2}}\right)^2} = 9.60 \times 10^9 \text{ Hz} \\
 \beta &= \frac{\omega}{c} \sqrt{1 - \left(\frac{9.60}{15}\right)^2} = 241.3 \text{ rad/m}
 \end{aligned}$$

And again, we need to find Beta so, Beta we know,

$$\begin{aligned}
 \beta &= \omega \sqrt{\mu \epsilon} \sqrt{1 - \left(\frac{f_c}{f}\right)^2} \\
 f_c &= \frac{1}{2 \sqrt{\mu \epsilon}} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \\
 &= \frac{3 \times 10^8}{2} \sqrt{\left(\frac{2}{5 \times 10^{-2}}\right)^2 + \left(\frac{1}{2 \times 10^{-2}}\right)^2} = 9.60 \times 10^9 \text{ Hz} \\
 \beta &= \frac{\omega}{c} \sqrt{1 - \left(\frac{9.60}{15}\right)^2} = 241.3 \text{ rad/m}
 \end{aligned}$$

So, we will get Beta as 241.3.

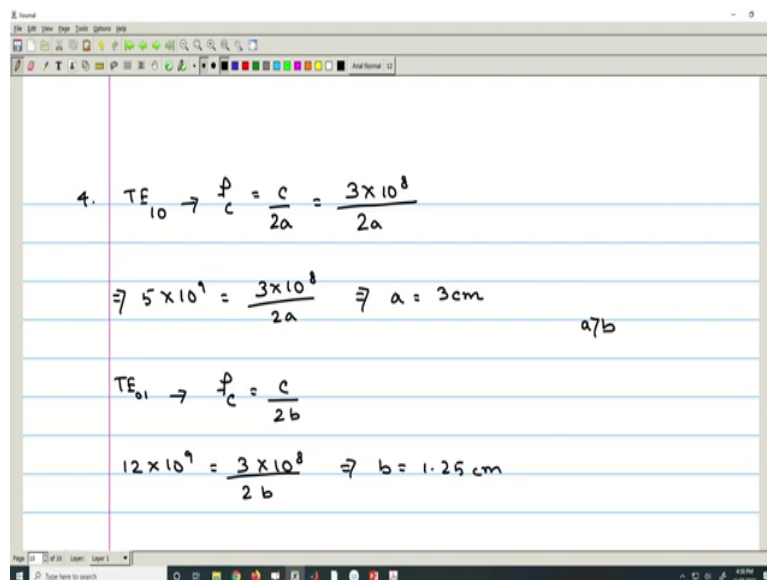

(Refer Slide Time: 27:26)

4. In an air-filled rectangular waveguide, the cutoff frequency of a  $TE_{10}$  mode is 5 GHz, whereas that of  $TE_{01}$  mode is 12 GHz. Calculate

- The dimensions of the guide
- The cutoff frequencies of the next three higher TE modes
- The cutoff frequency for  $TE_{11}$  mode if the guide is filled with a lossless material having  $\epsilon_r = 2.25$  and  $\mu_r = 1$

(Refer Slide Time: 28:08)

So,

$$TE_{10} \rightarrow f_c = \frac{c}{2a} = \frac{3 \times 10^8}{2a}$$

$$\Rightarrow 5 \times 10^9 = \frac{3 \times 10^8}{2a} \Rightarrow a = 3 \text{ cm}$$

a > b

$$TE_{01} \rightarrow f_c = \frac{c}{2b}$$

$$12 \times 10^9 = \frac{3 \times 10^8}{2b} \Rightarrow b = 1.25 \text{ cm}$$

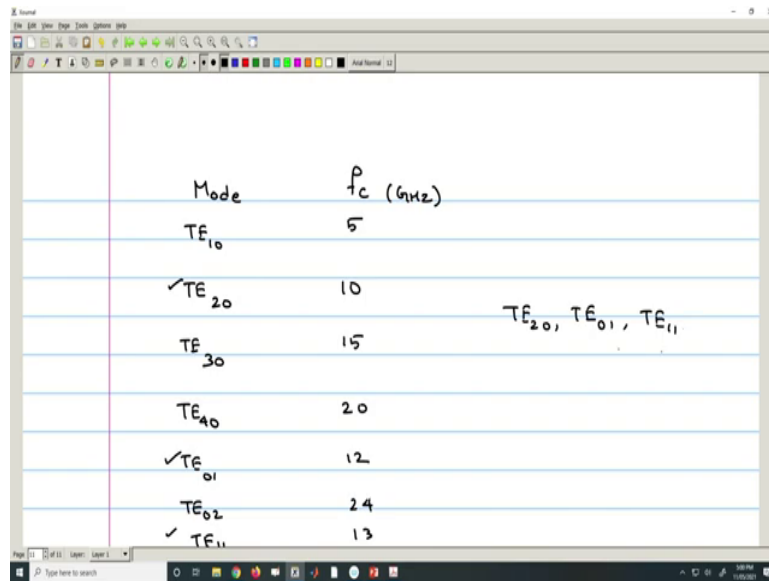

Now, since a is greater than b, since a is greater than b then next higher order modes are calculated as.

Mode	$f_c$ (GHz)
$TE_{10}$	5
✓ $TE_{20}$	10
$TE_{30}$	15
$TE_{40}$	20
✓ $TE_{01}$	12
$TE_{02}$	24
✓ $TE_{11}$	13

$TE_{20}, TE_{01}, TE_{11}$

(Refer Slide Time: 30:05)

Mode	$f_c$ (GHz)
$TE_{10}$	5
$\checkmark TE_{20}$	10
$TE_{30}$	15
$TE_{40}$	20
$\checkmark TE_{01}$	12
$TE_{02}$	24
$\checkmark TE_{11}$	13

$TE_{20}, TE_{01}, TE_{11}$

So, the next part:

$$f_c = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$$
$$u' = \frac{1}{\sqrt{\mu\epsilon}} = \frac{1}{\sqrt{\mu_0 \mu_r \epsilon_0 \epsilon_r}} = \frac{1}{\sqrt{\mu_0 \epsilon_0 (2.25)}} = 200 \times 10^6 \text{ m/s}$$
$$\therefore f_c = \frac{200 \times 10^6}{2} \sqrt{\left(\frac{1}{3 \times 10^{-2}}\right)^2 + \left(\frac{1}{1.25 \times 10^{-2}}\right)^2}$$
$$= 8.676 \text{ GHz}$$

(Refer Slide Time: 32:22)

The image shows a handwritten derivation on a digital whiteboard. It starts with the formula for the phase constant  $\beta_c = \frac{u'}{2} \sqrt{\frac{m^2}{a^2} + \frac{n^2}{b^2}}$ . Then, the phase velocity  $u' = \frac{1}{\sqrt{\mu\epsilon}} = \frac{1}{\sqrt{\mu_0 \mu_r \epsilon_0 \epsilon_r}} = \frac{1}{\sqrt{\mu_0 \epsilon_0 (2.25)}} = 200 \times 10^6 \text{ m/s}$  is calculated. Finally, the phase constant is evaluated as  $\beta_c = \frac{200 \times 10^6}{2} \sqrt{\left(\frac{1}{3 \times 10^{-2}}\right)^2 + \left(\frac{1}{1.25 \times 10^{-2}}\right)^2} = 8.676 \text{ m}^{-1}$ .

(Refer Slide Time: 34:28)

5. Calculate the dimensions of an air-filled rectangular waveguide for which the cutoff frequencies for  $TM_{11}$  and  $TE_{03}$  modes are both equal to 12 GHz. At 8 GHz, determine whether the dominant mode will propagate or evanesce in the waveguide.

Next question,

5. Calculate the dimensions of an air-filled rectangular waveguide for which the cutoff frequencies for  $TM_{11}$  and  $TE_{03}$  modes are both equal to 12 GHz. At 8 GHz, determine whether the dominant mode will propagate or evanesce in the waveguide.

(Refer Slide Time: 34:58)

$$57) f_c = \frac{u'}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2}$$

$$u' = \frac{1}{\sqrt{\mu\epsilon}}$$

$$f_c = \frac{c}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \quad \text{---}$$

$$f_{c_{11}} = \frac{3 \times 10^8}{2} \sqrt{\left(\frac{1}{a}\right)^2 + \left(\frac{1}{b}\right)^2}$$

Fine, so now again to start with we will start from cut-off frequency

$$f_c = \frac{u'}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2}$$

$$u' = \frac{1}{\sqrt{\mu\epsilon}}$$

$$f_c = \frac{c}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \quad \text{---}$$

$$f_{c_{11}} = \frac{3 \times 10^8}{2} \sqrt{\left(\frac{1}{a}\right)^2 + \left(\frac{1}{b}\right)^2}$$

(Refer Slide Time: 36:51)

$$\frac{3 \times 10^8}{2} \sqrt{\frac{1}{a^2} + \frac{1}{b^2}} = 12 \times 10^9 \quad \text{--- (1)}$$

$$\frac{3 \times 10^8}{2} \sqrt{\left(\frac{3}{b}\right)^2} = 12 \times 10^9 \quad \text{--- (2)}$$

$$\hookrightarrow \frac{3 \times 10^8}{2} \times \frac{3}{b} = 12 \times 10^9 \Rightarrow b = 3.75 \text{ cm}$$

$$a = 1.32 \text{ cm}$$

$$\therefore a < b$$

$$f_{c_{01}} = \frac{3 \times 10^8}{2 \times 3.75 \times 10^{-2}} = 4 \text{ GHz} < 8 \text{ GHz}$$

∴ dominant mode will propagate

$$\frac{3 \times 10^8}{2} \sqrt{\frac{1}{a^2} + \frac{1}{b^2}} = 12 \times 10^9 \quad \text{--- (1)}$$

$$\frac{3 \times 10^8}{2} \sqrt{\left(\frac{3}{b}\right)^2} = 12 \times 10^9 \quad \text{--- (2)}$$

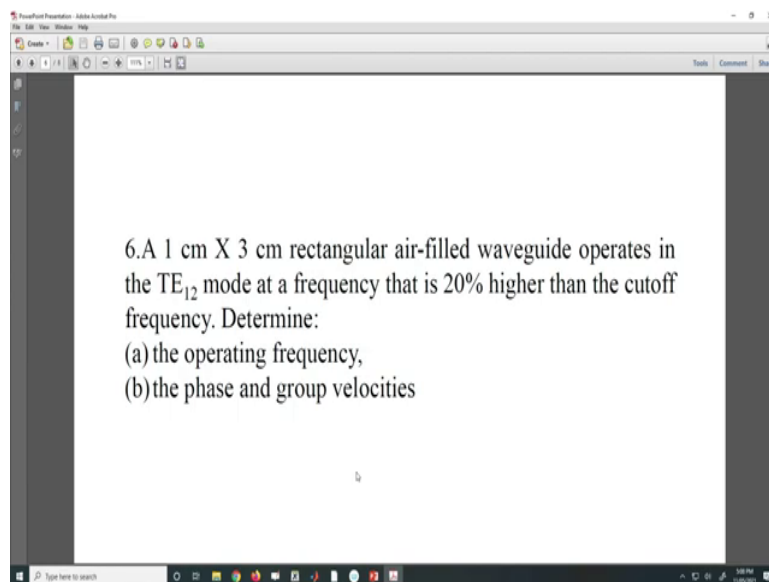

$$\hookrightarrow \frac{3 \times 10^8}{2} \times \frac{3}{b} = 12 \times 10^9 \Rightarrow b = 3.75 \text{ cm}$$

$$a = 1.32 \text{ cm}$$

$$\therefore a < b \quad f_{c01} = \frac{3 \times 10^8}{2 \times 3.75 \times 10^{-2}} = 4 \text{ GHz} < 8 \text{ GHz} \quad \therefore \text{dominant mode}$$

so, we can comment like that, a dominant mode will propagate, dominant mode will propagate, next question.

(Refer Slide Time: 39:40)

The next question says that

6. A 1 cm X 3 cm rectangular air-filled waveguide operates in the  $TE_{12}$  mode at a frequency that is 20% higher than the cutoff frequency. Determine:

- the operating frequency,
- the phase and group velocities

(Refer Slide Time: 40:10)

The image shows a screenshot of a digital whiteboard with a blue grid background. It contains the following handwritten mathematical steps:

$$\begin{aligned} 6) \quad f_c &= \frac{u'}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \\ &= \frac{3 \times 10^8}{2} \sqrt{\left(\frac{1}{1 \times 10^{-2}}\right)^2 + \left(\frac{2}{3 \times 10^{-2}}\right)^2} \\ &= 18.02 \text{ GHz} \\ \therefore f &= 1.2 f_c = 21.63 \text{ GHz (Ans)} \end{aligned}$$

So, in the given question, there is 1 centimeter cross 3-centimeter rectangular air-filled waveguide, and it is operating in TE 12 mode.

The image shows a digital whiteboard with a blue grid background. It contains the following handwritten mathematical steps:

$$\begin{aligned} f_c &= \frac{u'}{2} \sqrt{\left(\frac{m}{a}\right)^2 + \left(\frac{n}{b}\right)^2} \\ &= \frac{3 \times 10^8}{2} \sqrt{\left(\frac{1}{1 \times 10^{-2}}\right)^2 + \left(\frac{2}{3 \times 10^{-2}}\right)^2} \\ &= 18.02 \text{ GHz} \\ \therefore f &= 1.2 f_c = 21.63 \text{ GHz (Ans)} \end{aligned}$$

(Refer Slide Time: 42:11)

Handwritten calculations on a whiteboard:

$$b) \quad v_p = \frac{c}{\sqrt{1 - \left(\frac{f}{f_c}\right)^2}} = 5.427 \times 10^8 \text{ m/s}$$

$$v_g = \frac{u^2}{v_p} = \frac{(3 \times 10^8)^2}{5.427 \times 10^8} = 1.65 \times 10^8 \text{ m/s}$$

Now, sub part b :

Handwritten calculations on lined paper:

$$v_p = \frac{c}{\sqrt{1 - \left(\frac{f}{f_c}\right)^2}} = 5.427 \times 10^8 \text{ m/s}$$

$$v_g = \frac{u^2}{v_p} = \frac{(3 \times 10^8)^2}{5.427 \times 10^8} = 1.65 \times 10^8 \text{ m/s}$$

So, phase velocity and group velocity is done, next question.

(Refer Slide Time: 43:39)

7. A microwave transmitter is connected by an air-filled waveguide of cross section 2.5 cm X 1 cm to an antenna. For transmission at 11 GHz, find the ratio of the phase velocity to the medium velocity

So, the next question is

7. A microwave transmitter is connected by an air-filled waveguide of cross section 2.5 cm X 1 cm to an antenna. For transmission at 11 GHz, find the ratio of the phase velocity to the medium velocity

(Refer Slide Time: 44:17)

$$17 \quad f_c = \frac{3 \times 10^8}{2} \sqrt{\left(\frac{m}{2.5 \times 10^{-2}}\right)^2 + \left(\frac{n}{1 \times 10^{-2}}\right)^2}$$
$$= \frac{3 \times 10^8}{2 \times 10^{-2}} \sqrt{\frac{m^2}{2.5^2} + n^2} = 15 \sqrt{\frac{m^2}{2.5^2} + n^2}$$
$$f_{c_{10}} = 6 \text{ GHz} \quad f_{c_{01}} = 15 \text{ GHz} \times$$
$$f_{c_{20}} = 12 \text{ GHz} \times \quad \therefore \text{only TE}_{10} \text{ mode is propagated}$$

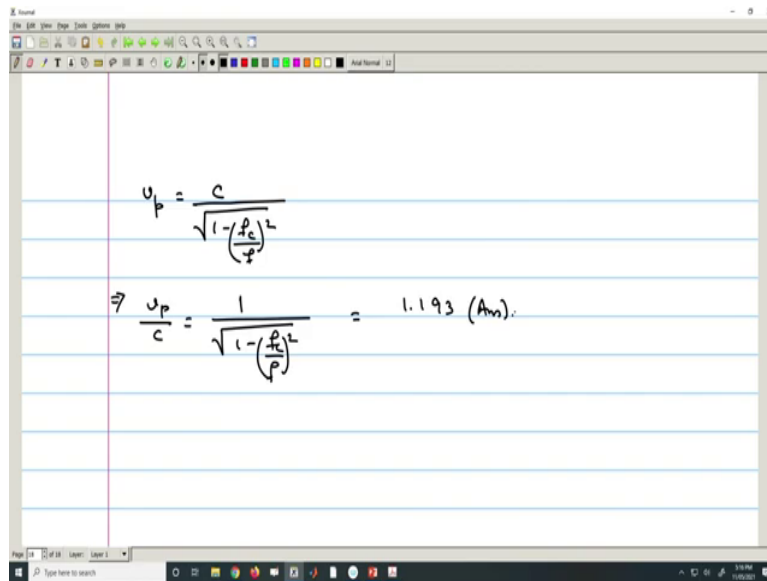

So, a microwave transmitter is connected by an air-filled waveguide, of cross section 2.5 centimeter cross 1 centimeter. So, again we will start with calculating the cut-off frequency

$$f_c = \frac{3 \times 10^8}{2} \sqrt{\left(\frac{m}{2.5 \times 10^{-2}}\right)^2 + \left(\frac{n}{1 \times 10^{-2}}\right)^2}$$
$$= \frac{3 \times 10^8}{2 \times 10^{-2}} \sqrt{\frac{m^2}{2.5^2} + n^2} = 15 \sqrt{\frac{m^2}{2.5^2} + n^2}$$
$$f_{c_{10}} = 6 \text{ GHz} \quad f_{c_{01}} = 15 \text{ GHz} \times$$
$$f_{c_{20}} = 12 \text{ GHz} \times \quad \therefore \text{only TE}_{10} \text{ mode is propagated}$$

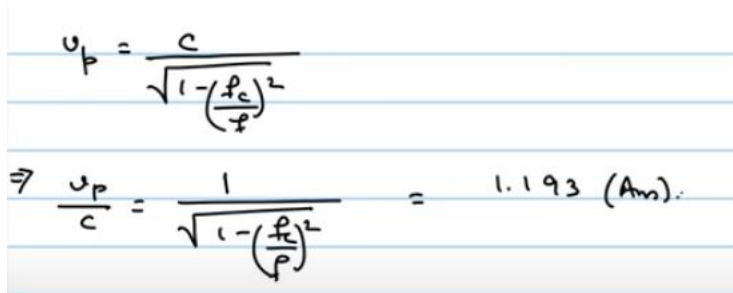

And then we will find the ratio of phase velocity to the medium velocity for this mode.

A screenshot of a digital whiteboard application. The whiteboard has a light blue background with horizontal lines. The top of the window shows a standard toolbar with various drawing and editing tools. The main content area contains two handwritten mathematical equations. The first equation is 
$$u_p = \frac{c}{\sqrt{1 - \left(\frac{f_c}{f}\right)^2}}$$
 and the second equation is 
$$\Rightarrow \frac{u_p}{c} = \frac{1}{\sqrt{1 - \left(\frac{f_c}{f}\right)^2}} = 1.193 \text{ (Ans).}$$

Handwritten mathematical formulas on a whiteboard. The first equation is 
$$u_p = \frac{c}{\sqrt{1 - \left(\frac{f_c}{f}\right)^2}}$$
 and the second equation is 
$$\Rightarrow \frac{u_p}{c} = \frac{1}{\sqrt{1 - \left(\frac{f_c}{f}\right)^2}} = 1.193 \text{ (Ans).}$$

So, thank you this is all for today.
