

Decision Support System for Managers
Prof. Kunal Kanti Ghosh
Vinod Gupta School of Management
Indian Institute of Technology, Kharagpur

Module – 02
Components of a Decision Support Systems
Lecture – 02
Components of a Decision Support Systems

Hi, welcome to our module 2 of Decision Support Systems! Today, we are going to discuss about the “Components of a Decision Support System”.

(Refer Slide Time: 00:31)

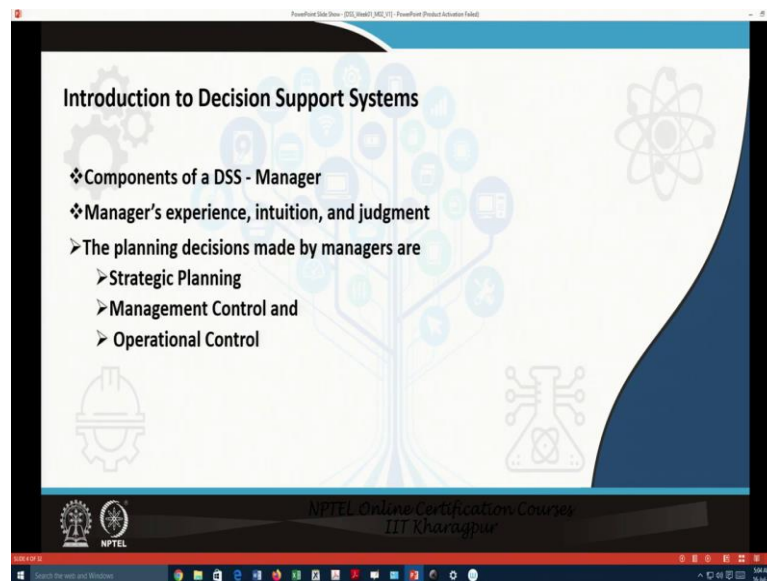

We have basically discussed that decision support systems are basically a man computer interactive system, mainly suited for solving semi structured problems. In here, the manager interacts with the computer. The models inside the computer will help the managers to give an initial output, which the manager will revise based on his interpretation of the output.

Manager might give a fresh set of data, he might asks new questions. So, you see two important components of a decision support systems are the manager and the model and then the manager has to communicate with the computer, that is why it is an interactive system and in an iterative manner.

So, computer and communication devices is a third component and the data which are basically needed to solve the problem must reside in the computer data base. So, the components of a decision support system are the manager, the models, the computer and communication devices and as well as the data base. Components of a decision support systems manager.

(Refer Slide Time: 02:20)

Introduction to Decision Support Systems

- ❖ Components of a DSS - Manager
- ❖ Manager's experience, intuition, and judgment
- The planning decisions made by managers are
 - Strategic Planning
 - Management Control and
 - Operational Control

NPTEL Online Certification Course
IIT Kharagpur

So, what we found out that the managers, they use their experience, intuition and judgement to interpret the model output and also to provide a new set of input if it requires. So, manager's experience, intuition and judgement, they are very much required. Along with that the planning decisions that are made by the managers are strategic planning, management control and operational control.

So, we need to know, what is meant by that strategic planning, what is meant by management control and what are the different aspects of operational control; because manager is the primary component of a decision support system.

(Refer Slide Time: 03:50)

Introduction to Decision Support Systems

- ❖ Components of a DSS - Manager
- ❖ Strategic planning deals with setting goals, changing goals, and setting policies for resource acquisition
- ❖ Management control deals with decisions to ensure that resources are obtained and used effectively and efficiently in the accomplishment of company objectives
- ❖ In operational control, the manager is concerned with efficient and effective execution of specific tasks

NPTEL Online Certification Course
IIT Kharagpur

So, the planning decisions made by managers must be understood in totality. Strategic planning, basically deals with long range plans, it is identifying or setting goals or objectives, it might also involve changing the goals and also deciding or setting policies for acquisition of resources to achieve the accomplished goal.

Management control deals with the decisions to ensure that those resources are obtained and used effectively and in an efficient manner towards accomplishment of those company objectives and goals. And in operational control, the manager is concerned with efficient and effective execution of specific tasks. So, in operational control we are bothered about efficient and effective execution of tasks specific tasks.

In the management control, we are basically trying to find out or ensure that the resources which are needed they have been obtained and used in an effective and efficient manner. And strategic planning deals with setting long range goals, changing the goals if required, and setting the different kinds of policies for acquisition of resources to solve the problem.

(Refer Slide Time: 05:54)

Introduction to Decision Support Systems

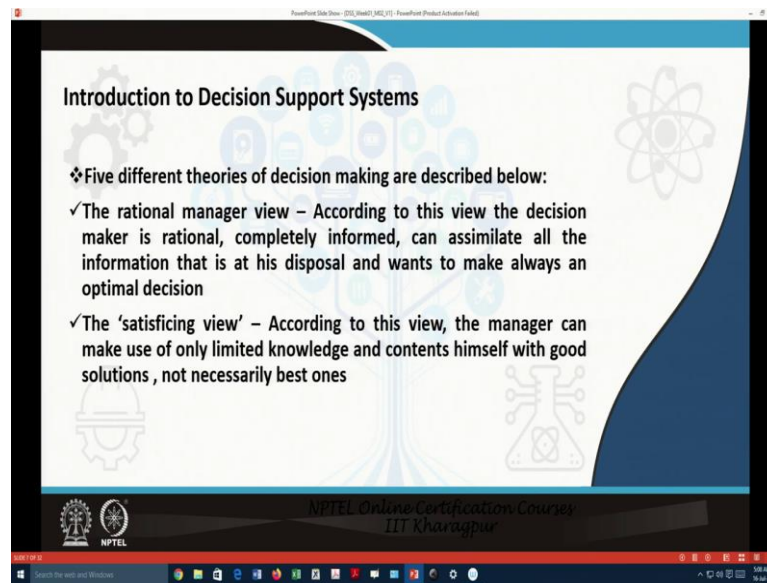

- ❖ Components of a DSS - Manager
- ❖ In each of these three classes of planning problems, the problems can be classified as structured, unstructured, or semi-structured
- ❖ Several theories exist on the way decisions are made in organizations
- ❖ A knowledge of these theories may be of help to the designers of a DSS in planning their strategy of design and implementation

NPTEL Online Certification Course
IIT Khargapur

In each of these three classes of planning problems, the problem can again be classified as structured, unstructured or semi-structured. Now, we had earlier discussed that in any decision making problem we are trying to find out or select the best alternative among the several set of alternatives that are available to solve a problem.

Now, several theories exist on the way, these particular alternative among that set of alternatives is chosen that is the way the decisions are made in organizations depend on several theories. Now, a knowledge of these theories may be of help to the designers of a Decision Support System in planning their strategy of design and implementation.

(Refer Slide Time: 07:12)

Introduction to Decision Support Systems

❖ Five different theories of decision making are described below:

- ✓ The rational manager view – According to this view the decision maker is rational, completely informed, can assimilate all the information that is at his disposal and wants to make always an optimal decision
- ✓ The 'satisficing view' – According to this view, the manager can make use of only limited knowledge and contents himself with good solutions, not necessarily best ones

NPTEL Online Certification Course
IIT Kharagpur

Five different theories of decision making we are going to discuss. First one is the rational manager view. According to this view the decision maker is rational, he is completely informed of the various factors that are influencing the problem, he can assimilate all the information that is at his disposal and wants to make always an optimal decision.

So, in rational manager's view, optimal decision making is the focus. Here, we are assuming the decision maker is completely rational, he is well informed, he can assimilate all the information that are there at his disposal and he will always try to make an optimal decision.

Next, the satisficing view. According to this view, the manager can make use of only limited knowledge and satisfies himself with good solutions, not necessarily the best ones. He is not bothered about finding the optimal solution. He is trying to find out more or less a good solution which will serve the purpose, because at a given point in time, the manager has got only limited knowledge of the environment which basically govern the problem.

(Refer Slide Time: 09:16)

Introduction to Decision Support Systems

❖ Different theories of decision making are described below:

- ✓ The organizational procedures view - According to this view the decisions made in an organization can be understood as the outputs of certain standard procedures invoked by organizational units
- ✓ The political view – According to this view, the outcomes of decisions in organizations are largely influenced by power of the individuals involved in the decision making process

NPTEL Online Certification Courses
IIT Kharagpur

Next, the organizational procedures view. According to this view the decisions made in an organization can be understood as the culmination or output of certain led down standard procedures invoked by those organizational units where the decision is been taken.

The next theory on decision making is the political view. According to this view, the outcomes of decisions in organizations are largely influenced by power of the individuals who are involved in the decision making process.

(Refer Slide Time: 10:22)

Introduction to Decision Support Systems

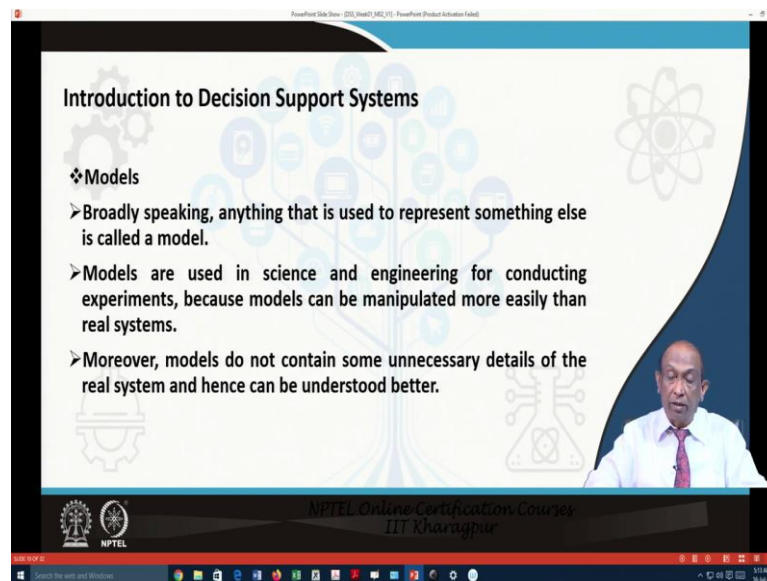

❖ Different theories of decision making are described below:

- ✓ The individual differences perspective – Here it is assumed that each individual has a different style of decision making and hence in designing a system the designer should understand its specific user rather than following some general assumptions

NPTEL Online Certification Courses
IIT Kharagpur

And, then the last view or the class theory is that individual differences perspective. Here, it is assumed that each individual has a different style of decision making and hence, in designing a system, the DSS designer must understand its specific user; he must try to understand the mental makeup of the manager who is taking the decision rather than following some general assumptions.

(Refer Slide Time: 11:13)

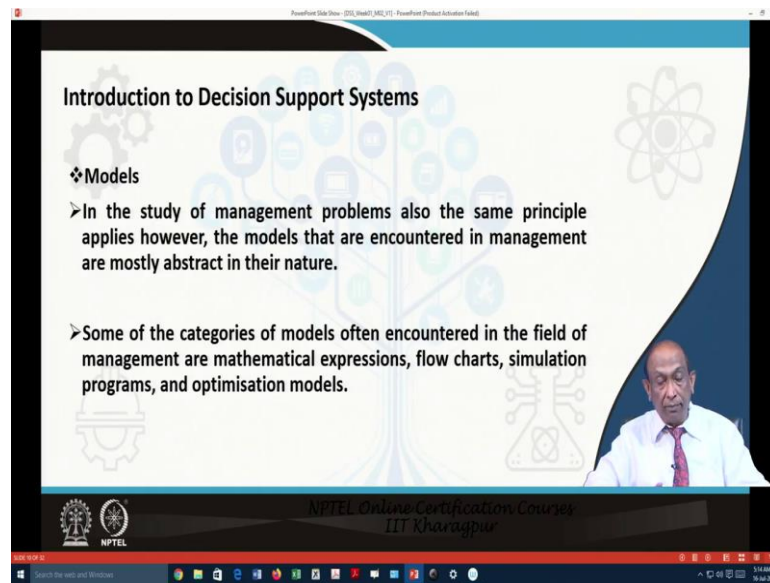

The image shows a screenshot of a presentation slide. The slide title is "Introduction to Decision Support Systems". Below the title, there is a section header "❖ Models". Under this section, there are three bullet points: "➤ Broadly speaking, anything that is used to represent something else is called a model.", "➤ Models are used in science and engineering for conducting experiments, because models can be manipulated more easily than real systems.", and "➤ Moreover, models do not contain some unnecessary details of the real system and hence can be understood better." In the bottom right corner of the slide, there is a small video inset showing a man in a white shirt and red tie speaking. The slide also features a background graphic of a tree with various icons and a logo of a stylized atom. At the bottom of the slide, there is text that reads "NPTEL Online Certification Courses IIT Kharagpur". The entire slide is displayed within a window titled "PowerPoint Slides - (02) (Slide) (1) - PowerPoint (Product Activation Failed)".

The next component of any decision support system is another very important one that is the models. Broadly speaking, anything that is used to represent something else is called a model. Anything that is used to represent something else is called a model.

Models have been widely used in the field of science and engineering for conducting several experiments, because models can be manipulated more easily than changing real systems. Moreover, models do not contain all those unnecessarily details of the real system and hence, we can understand the models much better.

(Refer Slide Time: 12:28)

Introduction to Decision Support Systems

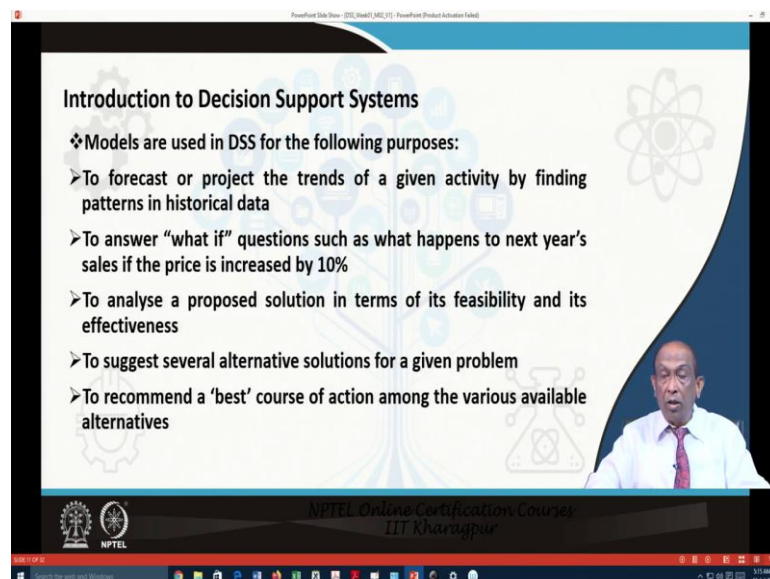

❖ **Models**

- In the study of management problems also the same principle applies however, the models that are encountered in management are mostly abstract in their nature.
- Some of the categories of models often encountered in the field of management are mathematical expressions, flow charts, simulation programs, and optimisation models.

NPTEL Online Certification Course
IIT Kharagpur

In the study of management problems also, the same principle applies; however, the models that are encountered in the field of management are mostly abstract in their nature. Some of the categories of models often encountered in the field of management are mathematical expressions, flow charts, simulation programs, and optimization models.

(Refer Slide Time: 13:19)

Introduction to Decision Support Systems

❖ **Models are used in DSS for the following purposes:**

- To forecast or project the trends of a given activity by finding patterns in historical data
- To answer “what if” questions such as what happens to next year's sales if the price is increased by 10%
- To analyse a proposed solution in terms of its feasibility and its effectiveness
- To suggest several alternative solutions for a given problem
- To recommend a 'best' course of action among the various available alternatives

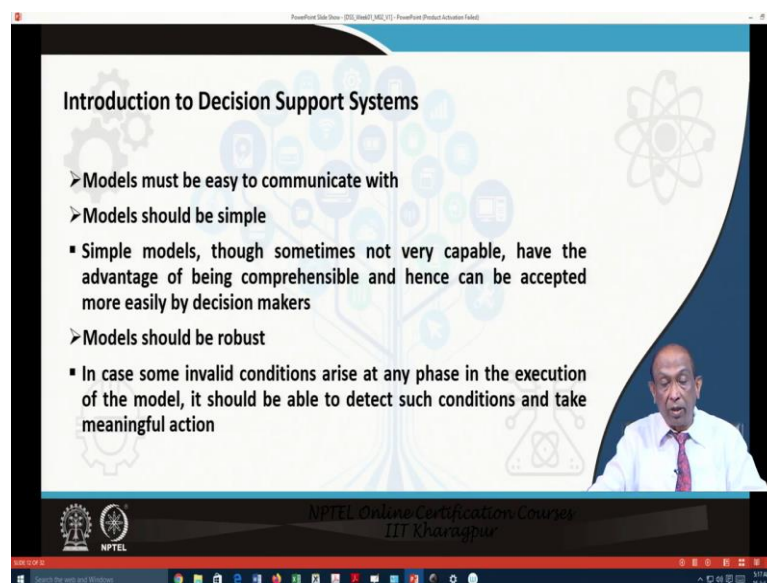

NPTEL Online Certification Course
IIT Kharagpur

Models that are used in Decision Support System solve the following purposes: number 1; to forecast or project the trends of a given activity by finding patterns in historical data.

All those forecasting models they basically try to find out the relationship or the pattern in data. To answer what if questions such as what happens to next year's sales if we increase the price by 10 percent. This class of problems are sometimes known as sensitivity analysis problem. How sensitive is thus, total volume of sales when the price is increased by some percentage.

Models are used to analyze a proposed solution in terms of its feasibility and its effectiveness. Models sometimes suggest several alternative solutions for a given problem and thereby, models they recommend a best course of action among the various available alternatives.

(Refer Slide Time: 15:20)

The image shows a screenshot of a video lecture slide. The slide is titled "Introduction to Decision Support Systems" and lists three key characteristics of models:

- Models must be easy to communicate with
- Models should be simple
 - Simple models, though sometimes not very capable, have the advantage of being comprehensible and hence can be accepted more easily by decision makers
- Models should be robust
 - In case some invalid conditions arise at any phase in the execution of the model, it should be able to detect such conditions and take meaningful action

The slide also features a small inset video of a speaker in the bottom right corner. The background of the slide includes a stylized atomic symbol and a tree-like diagram with various icons. The NPTEL logo is visible in the bottom left corner, and the text "NPTEL Online Certification Courses IIT Kharagpur" is at the bottom center. The Windows taskbar is visible at the very bottom of the screenshot.

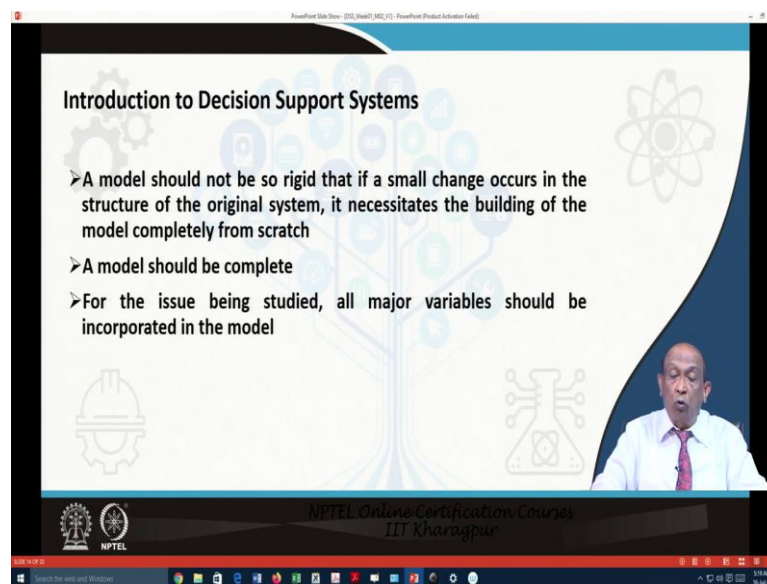

So, in an interactive system where the managers in the process of communicating with the computers, they are basically taking the help of these models to solve the problems and hence, models must be easy to communicate with models must be very simple to understand. The nature of models must be extremely simple so that the working managers really understand what this model is about? How this model is working?

Simple models, may not always be very capable, but they have the advantage of being comprehensible means managers can understand those models and hence the acceptance rate of those models go up. Decision makers accept those models which they can understand.

Models should be robust. What do we mean by robustness of a model? In case some invalid conditions arise at any phase in the execution of that model, it should be able to detect such conditions and then take meaningful action. For example, in a model sometimes division by 0 comes in.

So, in that case under this exception condition what should be the recommended course of action is in built into it? So, models robust models must take care of invalid conditions, if they arise at any phase in the execution of a model.

(Refer Slide Time: 17:50)

The image shows a screenshot of a presentation slide. The slide title is "Introduction to Decision Support Systems". It contains three bullet points: "A model should not be so rigid that if a small change occurs in the structure of the original system, it necessitates the building of the model completely from scratch", "A model should be complete", and "For the issue being studied, all major variables should be incorporated in the model". There is a video inset in the bottom right corner showing a man speaking. The slide also features decorative icons of a gear, a tree, and a chemical flask. At the bottom, there is a footer for "NPTEL Online Certification Course, IIT Kharyapur".

A model should not be. So, rigid that if a small change occurs in the structure of the original system, then it necessitates the building of the model completely from scratch then the purpose gets defeated.

A model should be flexible enough such that you do not need to build another model from scratch, if there is any change in the structure of the original system. A model should be complete in all respect and for the issue being studied all major variables should be incorporated in the model otherwise; the purpose will not be served.

(Refer Slide Time: 18:45)

Introduction to Decision Support Systems

- Models define the relations between several important entities of the system, and are valid only under some assumptions.
- The price determination example that has been described earlier uses set of four equations as its model.
- The equations used there-in are given in the next slide:

NPTEL Online Certification Course
IIT Kharagpur

Models define the relations between several important entities of the system and as we have already discussed, these are valid only under some assumptions. The price determination example that I was described earlier uses the set of four equations, as we are showing it in this slides; $Y_1 - K_{11} X_1 - K_{12} X_2 = K_{13}$ that is the first equation.

(Refer Slide Time: 19:16).

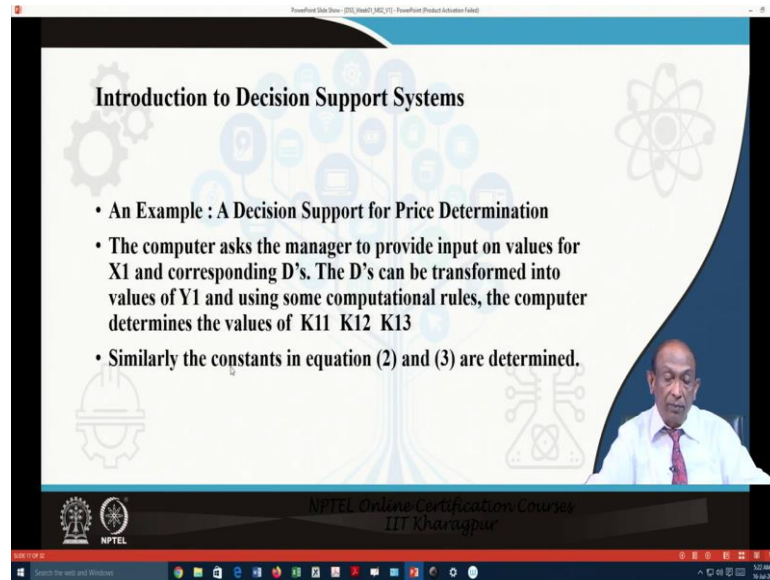

Introduction to Decision Support Systems

- $(Y_1 - K_{11}) (X_1 - K_{12}) = K_{13}$ -----(1)
- $(Y_2 - K_{21}) (X_2 - K_{22}) = K_{23}$ -----(2)
- $(Y_3 - K_{31}) (X_3 - K_{32}) = K_{33}$ -----(3) and
- $D = K (Y_1^a) (Y_2^b) (Y_3^c)$ -----(4)

NPTEL Online Certification Course
IIT Kharagpur

In this manner all these three equations and the last three questions the last equation fourth equation the demand is related to all these three indices Y_1 , Y_2 and Y_3 with their respective weights a , b and c .

(Refer Slide Time: 19:53)

The image shows a presentation slide titled "Introduction to Decision Support Systems". The slide contains three bullet points:

- An Example : A Decision Support for Price Determination
- The computer asks the manager to provide input on values for X_1 and corresponding D 's. The D 's can be transformed into values of Y_1 and using some computational rules, the computer determines the values of K_{11} K_{12} K_{13}
- Similarly the constants in equation (2) and (3) are determined.

The slide features a background with various icons including gears, a lightbulb, and a network diagram. In the bottom right corner, there is a small video inset of a man in a white shirt and tie. The slide is part of an NPTEL Online Certification Course from IIT Kharagpur, as indicated by the footer.

In here, the computer asked the manager to provide input on values for X_1 and corresponding these, that is a demand price index or demand quality index or demand advertising index, those are all Y_1 , Y_2 , Y_3 . These are overall demand for the product and these D 's can be transformed into values of Y_1 and using some computational rules, the computer determines the values of K_{11} , K_{12} , K_{13} as well as other constants.

(Refer Slide Time: 21:01)

Introduction to Decision Support Systems

- These three equations define the relation between a demand-index and one independent variable while holding other independent variables constant
- The computer makes use of equation (4) for determining the demand when more than one of the independent variables change.
- a, b, and c are weights that determine the relative importance of each of the three indices Y_1 , Y_2 and Y_3

NPTEL Online Certification Courses
IIT Kharagpur

Similarly, the constants in equation 2 and 3 are determined. These three equations define the relation between a demand index and one independent variable while holding the other independent variables constant. And the computer makes use of equation 4, the last equation to determine the demand when more than one of the independent variables change. And in that equation a, b and c are weights that determine the relative importance of the three indices Y_1 , Y_2 and Y_3 .

(Refer Slide Time: 21:57)

Introduction to Decision Support Systems

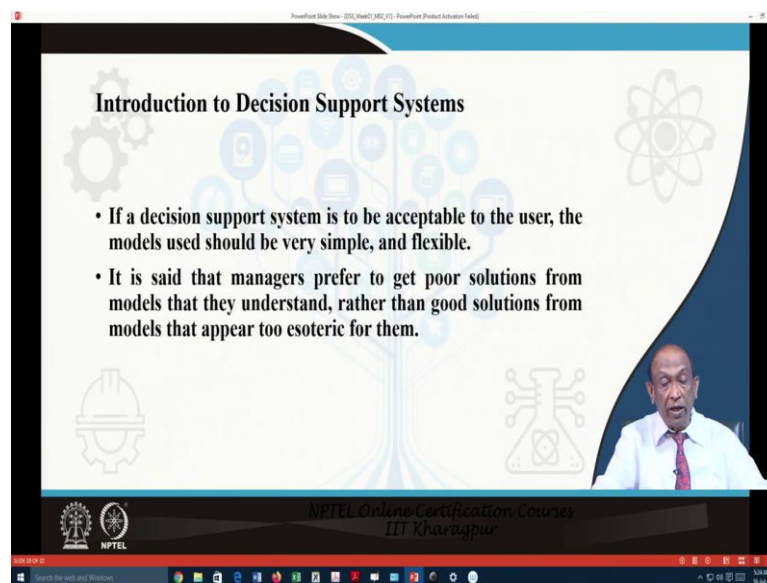

- Using equations 1,2, and 3, the weights a, b and c are determined by the computer and for certain levels of the three variables and for certain changes in two of the three variables, the demand is computed and output.
- The manager can have the values of the weights revised, if the value given above does not agree with what he intuitively expects.

NPTEL Online Certification Courses
IIT Kharagpur

Using equations 1, 2 and 3, the weights a, b and c are determined by the computer and for certain levels of the three variables and for certain changes in two of the three variables, the demand is computed and output.

The manager can have the values of this weights revised, if the value given above does not agree with what he intuitively expects.

(Refer Slide Time: 22:33)

The screenshot shows a video lecture slide with the following content:

Introduction to Decision Support Systems

- If a decision support system is to be acceptable to the user, the models used should be very simple, and flexible.
- It is said that managers prefer to get poor solutions from models that they understand, rather than good solutions from models that appear too esoteric for them.

The slide features a background with various icons including gears, a hard hat, a circuit board, and a molecular structure. A small video inset in the bottom right corner shows a man in a white shirt and red tie speaking. The NPTEL logo and 'NPTEL Online Certification Course IIT Kharagpur' are visible at the bottom of the slide.

So, that is why we want to say that the most important thing is that any decision support system has to be acceptable to the user, the models used should be very simple, and flexible. It is said that managers prefer to get poor solutions from models that they understand, rather than good solutions from models that they do not understand. Models that appear too esoteric for them, those models are never accepted by the managers.

(Refer Slide Time: 23:33)

Introduction to Decision Support Systems

❖ Components of DSS - Computer and Communication Devices:

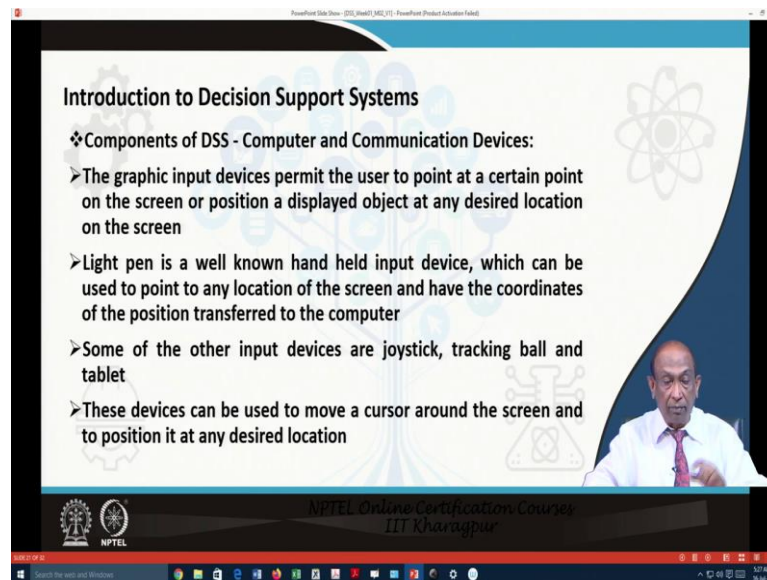

- The ability to interact with computer in an on-line mode is the essence of conversational characteristics of any DSS
- The information content of any data is grasped by humans much more rapidly if it is displayed in the form of a diagram rather than as a table of numbers
- In many DSS, we find display of pictures through graphic terminals
- The user can specify positional input more easily and naturally

NPTEL Online Certification Course
IIT Kharagpur

In discussing the components of decision support system, the third one is the computer and communication devices. The ability to interact with computer in an online mode is the essence of conversational characteristics of any DSS. The information content of any data is grasped by humans much more rapidly if it is displayed in the form of a diagram rather than as a table of numbers. A picture is much more worth than a set of numbers.

In many decision support system, we find display of pictures through graphic terminals. The user can specify positional input more easily and naturally through those graphic terminals, through those graphic a, because he can position the mouse pointer there and the coordinates get captured. So, these were can specify positional input more easily and naturally and those coordinates will be captured by the model.

(Refer Slide Time: 25:20)

The screenshot shows a presentation slide with the following content:

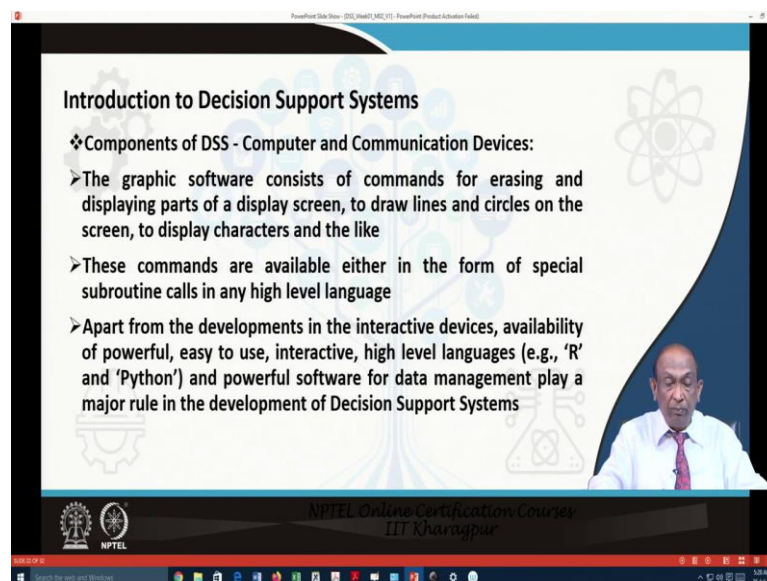

Introduction to Decision Support Systems

- ❖ Components of DSS - Computer and Communication Devices:
 - The graphic input devices permit the user to point at a certain point on the screen or position a displayed object at any desired location on the screen
 - Light pen is a well known hand held input device, which can be used to point to any location of the screen and have the coordinates of the position transferred to the computer
 - Some of the other input devices are joystick, tracking ball and tablet
 - These devices can be used to move a cursor around the screen and to position it at any desired location

The slide also features a small video inset of a man in a white shirt and tie, and a logo of a stylized atom in the top right corner. The bottom of the slide includes the NPTEL logo and the text 'NPTEL Online Certification Courses IIT Kharagpur'.

The graphic input devices permit the user to point at a certain point on the screen or position a displayed object at any desired location on the screen, as I had rightly told you earlier. And the you see, light pen is a well known hand held input device, which can be used to point to any location of the screen and have the coordinates of that position transferred to the computer. Some of the other input devices are joystick, tracking ball and tablet. These devices can be used to move a cursor around that screen and to position it at any desired location.

(Refer Slide Time: 26:08)

The screenshot shows a presentation slide with the following content:

Introduction to Decision Support Systems

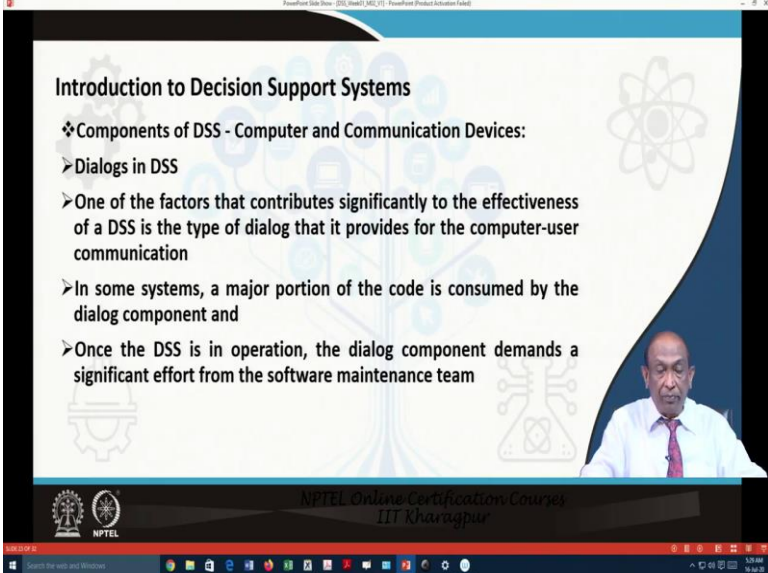

- ❖ Components of DSS - Computer and Communication Devices:
 - The graphic software consists of commands for erasing and displaying parts of a display screen, to draw lines and circles on the screen, to display characters and the like
 - These commands are available either in the form of special subroutine calls in any high level language
 - Apart from the developments in the interactive devices, availability of powerful, easy to use, interactive, high level languages (e.g., 'R' and 'Python') and powerful software for data management play a major role in the development of Decision Support Systems

The slide also features a small video inset of a man in a white shirt and tie, and a logo of a stylized atom in the top right corner. The bottom of the slide includes the NPTEL logo and the text 'NPTEL Online Certification Courses IIT Kharagpur'.

The graphic software consists of commands for erasing and displaying parts of a display screen, to draw lines and circles on the screen, to display characters and the like. These commands are available either in the form of special subroutine calls in any high level language.

Apart from the developments in the interactive devices availability of powerful, easy to use, interactive, high level languages. For example, R and Python and powerful software for data management systems play a very important role in the development of Decision Support Systems.

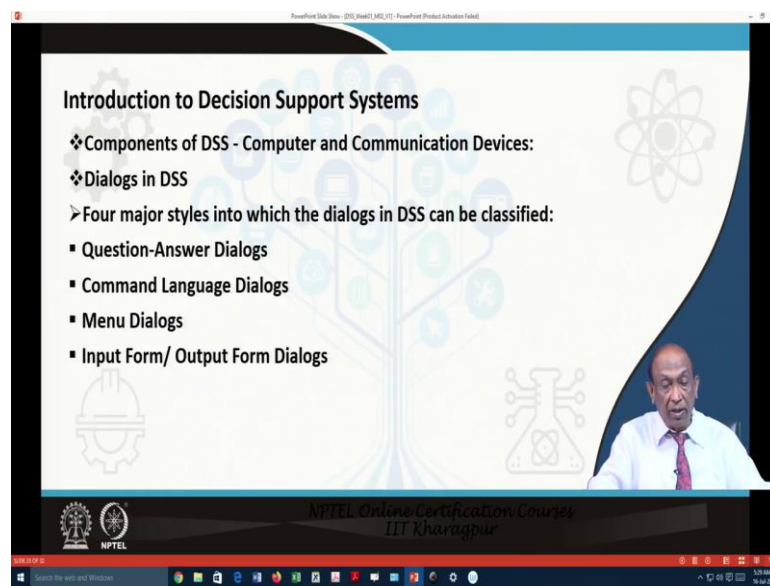

(Refer Slide Time: 26:58)

The image shows a screenshot of a presentation slide. The slide title is "Introduction to Decision Support Systems". Below the title, there is a section header "❖ Components of DSS - Computer and Communication Devices:" followed by a list of points under the heading "➤ Dialogs in DSS". The points are: "➤ One of the factors that contributes significantly to the effectiveness of a DSS is the type of dialog that it provides for the computer-user communication", "➤ In some systems, a major portion of the code is consumed by the dialog component and", and "➤ Once the DSS is in operation, the dialog component demands a significant effort from the software maintenance team". The slide also features a small video inset of a man in a white shirt and red tie in the bottom right corner. At the bottom of the slide, there is a footer that reads "NPTEL Online Certification Courses IIT Kharagpur". The slide is displayed in a window titled "PowerPoint Web Viewer - [DSS_Week1_MSC_1] - PowerPoint (Product Activation Failed)".

Another important thing is that the dialogs in DSS. One of the factors that contribute significantly to the effectiveness of a DSS is the type of dialog that it provides for the computer user communication. In some systems, a major portion of the code is consumed by the dialog component and once the DSS is in operation, the dialog component demands a significant effort from the software maintenance team.

(Refer Slide Time: 27:31)

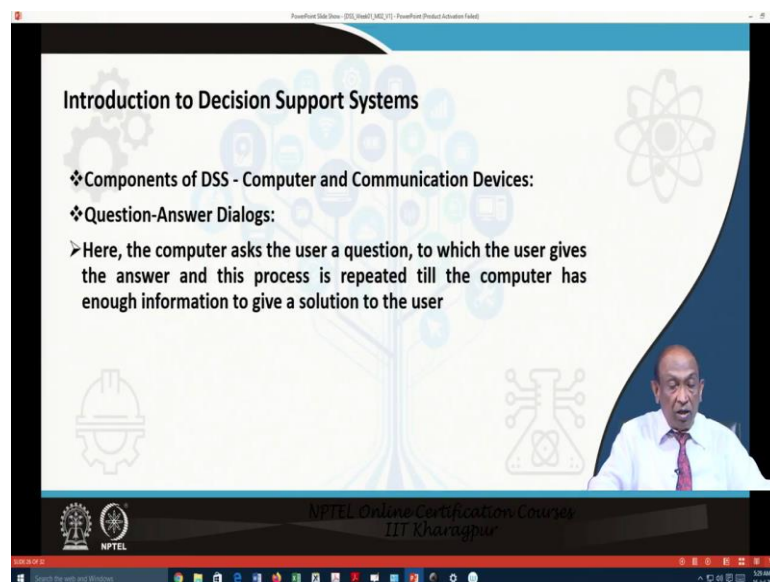

The screenshot shows a presentation slide with the following content:

- ❖ Components of DSS - Computer and Communication Devices:
- ❖ Dialogs in DSS
 - Four major styles into which the dialogs in DSS can be classified:
 - Question-Answer Dialogs
 - Command Language Dialogs
 - Menu Dialogs
 - Input Form/ Output Form Dialogs

The slide also features a small video inset of a speaker in the bottom right corner and a footer with the NPTEL logo and text: 'NPTEL Online Certification Courses IIT Kharagpur'.

Four major styles into which the dialogs in DSS can be classified are the question and answer dialogs, command language dialogs, menu dialogs input form and output form dialogs. All of you are familiar with all these four major styles of dialogs.

(Refer Slide Time: 27:49)

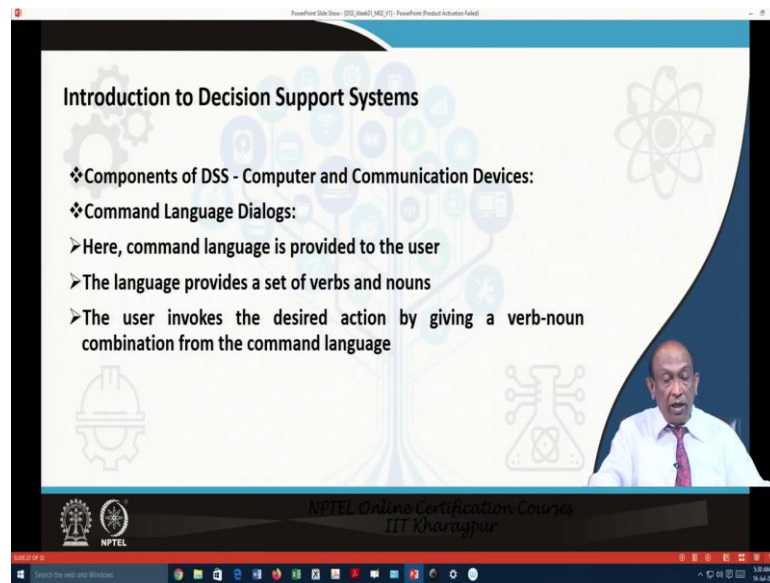

The screenshot shows a presentation slide with the following content:

- ❖ Components of DSS - Computer and Communication Devices:
- ❖ Question-Answer Dialogs:
 - Here, the computer asks the user a question, to which the user gives the answer and this process is repeated till the computer has enough information to give a solution to the user

The slide also features a small video inset of a speaker in the bottom right corner and a footer with the NPTEL logo and text: 'NPTEL Online Certification Courses IIT Kharagpur'.

Question answer dialogs here; the computer asks the user a question to which the user gives the answer and this process is repeated till the computer has enough information to give a solution to the user.

(Refer Slide Time: 28:04)

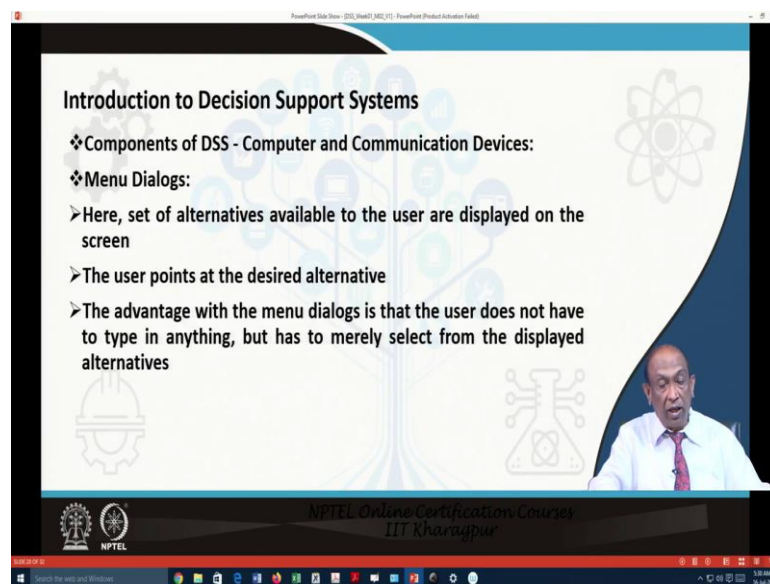

The screenshot shows a presentation slide with the following content:

- ❖ Components of DSS - Computer and Communication Devices:
- ❖ Command Language Dialogs:
 - Here, command language is provided to the user
 - The language provides a set of verbs and nouns
 - The user invokes the desired action by giving a verb-noun combination from the command language

The slide also features a small video inset of a speaker in the bottom right corner and a footer with the NPTEL logo and text: "NPTEL Online Certification Courses IIT Kharagpur".

In the command language dialog, the language provides a set of verbs and nouns. User invokes the desired action by giving a verb-noun combination from the command language.

(Refer Slide Time: 28:16)

The screenshot shows a presentation slide with the following content:

- ❖ Components of DSS - Computer and Communication Devices:
- ❖ Menu Dialogs:
 - Here, set of alternatives available to the user are displayed on the screen
 - The user points at the desired alternative
 - The advantage with the menu dialogs is that the user does not have to type in anything, but has to merely select from the displayed alternatives

The slide also features a small video inset of a speaker in the bottom right corner and a footer with the NPTEL logo and text: "NPTEL Online Certification Courses IIT Kharagpur".

In menu dialogs, the user points at a desired alternative out of the set of alternatives available to him and the advantage here is that the user does not have to type in anything, but as to merely select from the displayed alternatives.

(Refer Slide Time: 28:33)

The screenshot shows a presentation slide with the following content:

- Introduction to Decision Support Systems**
- ❖ Components of DSS - Computer and Communication Devices:
- ❖ Input Form / Output Form Dialogs:
 - Here, the computer displays an input form, similar to the paper forms familiar to the user
 - The user can enter values into the input form
 - The output is also displayed in a form familiar to the user
 - Then the user can request for and fill in another input form to continue the dialog

The slide also features a small video inset of a speaker in the bottom right corner and the NPTEL logo in the bottom left. The background has a blue and white abstract design with icons of a gear, a brain, and a circuit board.

And the input form and output form dialogs here, the computer displays an input form similar to the paper forms familiar to the user. The user can enter values in the input form; the output is also displayed in a form, familiar to the user. Then the user can request for and fill in another input form to continue the dialog.
