Lecture – 15
Vector spaces with finite generating system

Welcome back to this course on Linear Algebra. As you know, that last lectures I have been talking about the concepts of generating systems, linear independence, and basics. This lecture I will introduce a concept of dimension and we will prove that every vector space as a basis; and any two basis have the same cardinality, and this common cardinality will be called a dimension of a vector space.

(Refer Slide Time: 01:03)

So, let me do it first. So, as usual K is an arbitrary field and V is a K -vector space. And as a first step we will assume first that V has a finite generating system. This we will make this assumption for a today's lecture and may be the next lecture we will deal with arbitrary vector spaces. So, first I want to prove that V has a basis and V has the any two basis have the same number of elements. So, we note that from the last lectures we note that if we have a finite generating system then every other generating system will contain a finite generating system. Then I will just note it here this will be used again and again every other generating system of V will contain of finite generating system.

Let me recall the proof of this very quickly. So, we have given V has some finite generating system. So, let $v_i, i \in I$, be a finite generating system for V , and let $x_j, j \in J$, be an arbitrary generating system for V . v_i is the finite generating system in these i set is finite set, and this j could be finite j could be infinite, but we want to extract sub family from x_j which generate V . Well, so it say generating system, so now, let us this is a generating system means every vector in v is a linear combination of this x_j 's.

So, in particular this v_i 's. So, for each $i \in I$, v_i has a representation in terms of this x_j . So, that is $a_{ij} x_j, j \in J$, and where this a_{ij} tuple j is varying here this should be in k power round bracket J . Please recall the notation round upper round bracket j means only this a_{ij} s are almost all zero for all $j \in J$, for a fixed I , I is fixed. So, now, it is clear that if I take the subset J prime, J prime consist of all those $j \in J$ such that a_{ij} not a prime all though $j \in J$, such that a_{ij} is nonzero for some i . This is subset of J and it is clearly finite subset of J , because if we fix and index i then only finitely many a_{ij} 's are nonzero. So, I am putting it all, so which clearly finite and also what is clear is I am going to next; I am not able to go next page.

By insert new page.

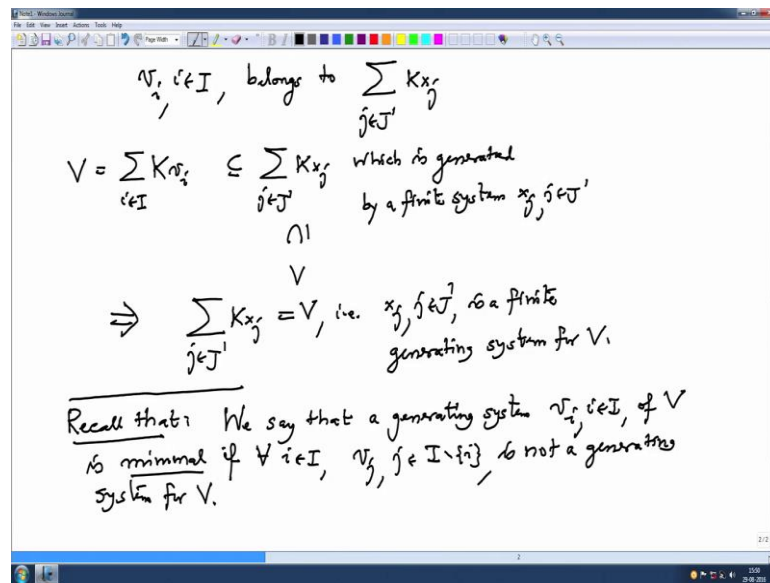

Insert, it is stuck.

[FL].

Ok, sorry.

[FL].

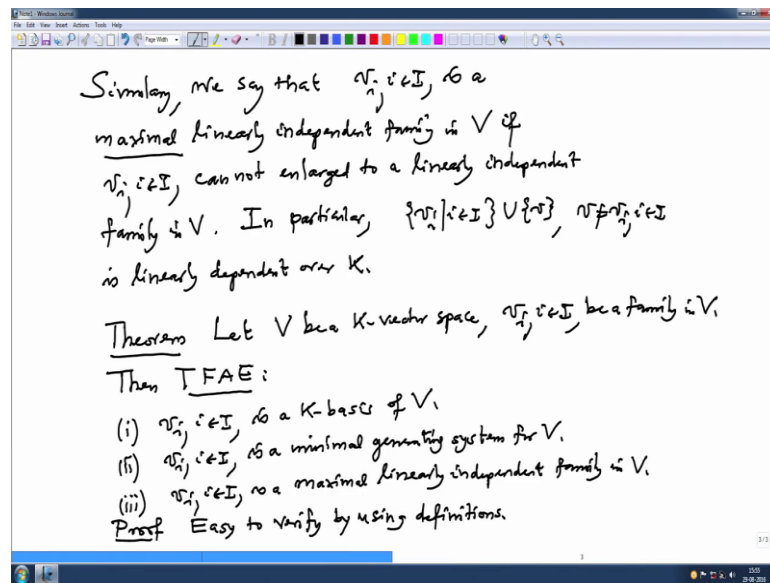

(Refer Slide Time: 07:17)

So, this J' is a finite subset of J , and also it is clear that all this v_i 's, i in I belongs to the subspace generated by x_j where j is varying in J' . So, that means, $\sum_{i \in I} Kx_i$ subspace generated by v_i 's which is the whole V because v_i is the generating system this is contained in the subspace $\sum_{j \in J'} Kx_j$, j in J' when this subspace has a generating system finite generating system, which is generated by the finite system x_j, j varying in J' . So, that means, it should be equal here because this is a subspace, subspace of V , but this already V . So, all together we conclude is subspace generated by $\sum_{j \in J'} Kx_j$ is the whole V , so that precisely means that x_j, j in J' is a finite generating system for V . So, we have justified our claim saying that if V has a finite generating system then every other generating system will contain a finite generating system.

And now also last time, we saw that which again I recall for the sake of completeness. Recall that we have seen that we call first of all let us recall the definition, we call we say that generating system v_i, i in I , of V is called or we say that the generating system is minimal. If for every i in I , if I omit v_i from this family, it will not be a generating system v_j, j is in I minus this i is not a generating system for V . So, we cannot afford to drop any vector from this generating system that is a minimal 1.

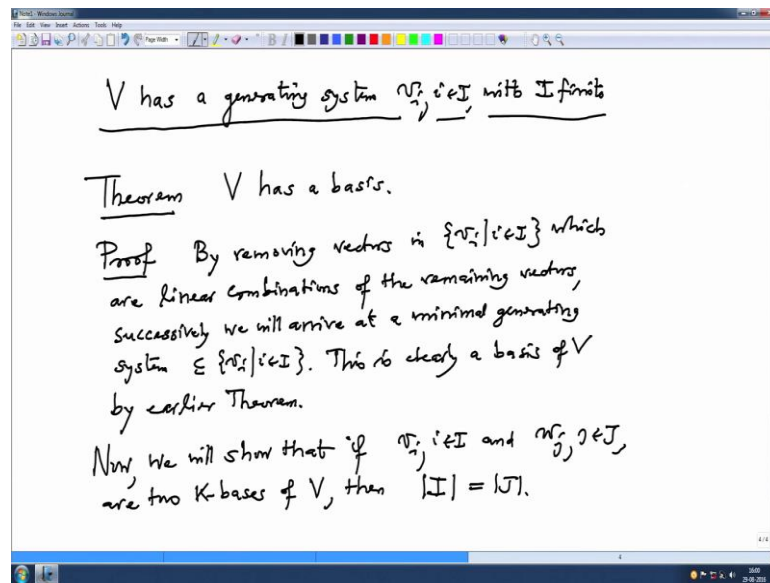

(Refer Slide Time: 11:01)

Similarly, we will say that family v_i is maximal linearly independent family in V , if we cannot enlarge v_i to a bigger linearly independent family. If $v_i, i \in I$, cannot be enlarged to linearly independent family in V . In particular, we cannot add one vector in v_i family $v_i, i \in I$, union some other vector v , where v is not in v_i is linearly dependent over K .

And also now it is very easy to see that I will just note in the form of theorem. Theorem, let V be a K -vector space, and $v_i, i \in I$, be a family in V . Then the following are equivalent, I will use this TFAE in the short form for the following are equivalent. Number one - $v_i, i \in I$, is a K -basis of V ; two - $v_i, i \in I$, is a minimal generating system for V ; and number three - $v_i, i \in I$, is a maximal linearly independent family in V . The equivalence of this is really very easy and I want to skip the proof, so proof I will just say easy to verify by using definitions.

(Refer Slide Time: 15:15)

So, our assumptions, remember or what we are assuming is v_i as the finite generating system that means, if we have V has a generating system $v_i, i \in I$, with I finite. Of course, one could also take i equal to 1 to n and write instead of writing $v_i, i \in I$, v_1 to v_n , but there is no harm in writing in general index. So, this is our assumption. Now the earlier theorem to prove that; so let me write this as a theorem, theorem this is what we want to prove, theorem with these assumption V has a basis.

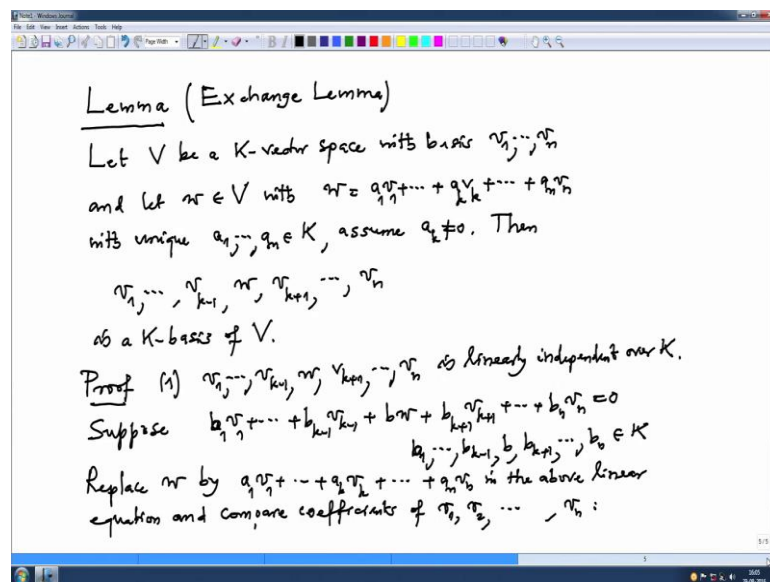

Proof, So, I want to I start with this finite generating system; there are only finitely mean elements in this family. So, I check that whether some vectors are needed in this family or not that means, whether vector is a linear combination of the remaining other once if it is so then I will remove it from this family. And continuing this process, we will arrive at a family which is a minimal generating system; and this is possible because this a either finite set we are only doing finitely many steps. So, proof is very simple by removing vectors in this family v_i , which are linear combinations of the remaining once remaining vectors, successively we will arrive at a minimal generating system which is contained in this family v_i .

And as we saw earlier theorem that minimal generating system is a basis. So, this will be this is clearly a basis of V by earlier theorem. Note that V , this process terminate because I is the finite set. So, it in finitely many steps, we will arrive at basis; however, we cannot do such a process for infinite set in general. So, we will have to use some more stronger

form of sets theory to prove these things, which we will postpone till next time. But now our main problem is to show that if $v_i, i \in I$, and $w_j, j \in J$ are two K -bases of V then the cardinality of I equals the cardinality of J . And note that both I and J are finite because we are assuming that a generating system for V has a finite generating system which has finitely many elements and therefore, any other generating system will also have subsystems which are finite generating systems.

So, we could concentrate on finite generating. So, V has a finite basis. So, all bases of V are finite. So, and we want to prove that now any two bases of the same number of cardinality. So, we will prepare for this.

(Refer Slide Time: 20:20)

So, first I will prove a lemma, so that is very important lemma for many purposes. This is called exchange lemma. So, let V be K -vector space and with basis, now I will call it v_1 to v_n . And let w be another vector in V , so definitely because v_1 to v_n is the basis this w we can write uniquely as with w , I can write uniquely as $a_1 v_1 + \dots + a_k v_k + \dots + a_n v_n$ with unique a_1, \dots, a_n in scalars. And if w is nonzero some scalar has to be nonzero otherwise w itself will be zero vector. And we will assume a_k is the nonzero so that means, this v_k occurs in the expression of w . Then v_1 to v_{k-1} and I want to drop v_k from this basis; and instead of v_k , I want to replace by w . So, I am exchanging the vector v_k in the basis with the vector w and I

want to claim then this is a K-basis of V and we shall make repeated use of this lemma, first let us prove this lemma.

So, we want to prove this v_1 to v_{k-1} w v_{k+1} to v_n is a basis so that means, we need to check two things. We want to check that they are linearly independent and it also generates. So, first let us prove that they are linearly independent. Proof, one - v_1 to v_{k-1} comma w , v_{k+1} to v_n this is linearly independent over K. So, to prove this, let us assume some linear combination of them is 0, and then we need to conclude that all coefficients are 0. So, suppose $b_1 v_1 + \dots + b_{k-1} v_{k-1} + b w + b_{k+1} v_{k+1} + \dots + b_n v_n = 0$, where $b_1, b_{k-1}, b_{k+1}, \dots, b_n$ these are the scalars. And now we want to conclude all b's are 0.

Well, we have an expression for w in terms of v_1 to v_n we will plug it in here, and compare the coefficients of v_1 v_2 etcetera etcetera v_n to be 0, because it is a basis if a combination is 0 then each coefficient must be 0. So, replace w by its expression unique expression $a_1 v_1 + \dots + a_k v_k + \dots + a_n v_n$ in the above linear equation and compare coefficients of v_1, v_2 etcetera etcetera up to v_n what do you get let us see.

(Refer Slide Time: 25:49)

$$\text{Coeff. of } v_1: b_1 + b a_1 = 0$$

$$b_2 + b a_2 = 0$$

$$\vdots$$

$$b_{k-1} + b a_{k-1} = 0$$

$$b a_k = 0 \rightarrow b = 0, \text{ since } a_k \neq 0 \text{ and } K \text{ is a field}$$

$$b_{k+1} + b a_{k+1} = 0$$

$$\vdots$$

$$b_n + b a_n = 0 \quad b_1 = b_2 = \dots = b_{k-1} = 0 = b_{k+1} = b_{k+2} = \dots = b_n$$

(2) $v_1, \dots, v_{k-1}, v_{k+1}, \dots, v_n$ is a generating system for V.
 We know that $v_1, \dots, v_{k-1}, v_k, v_{k+1}, \dots, v_n$ is a generating system for V.

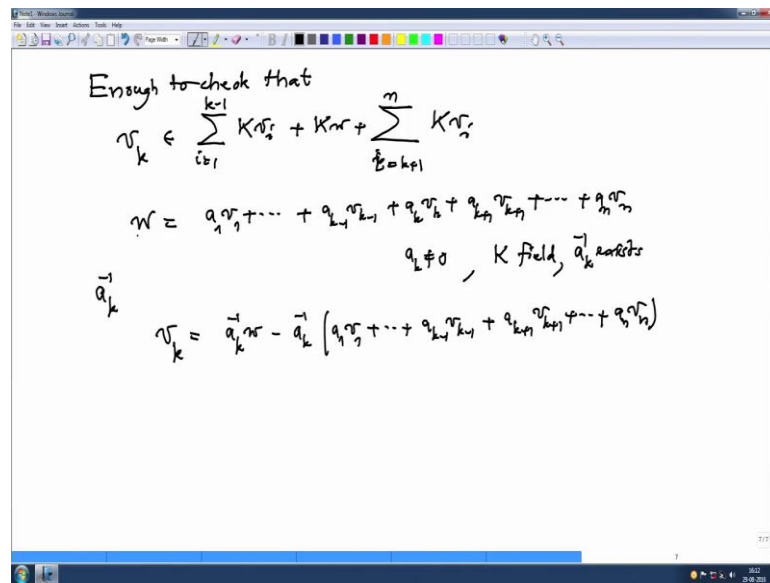

So, first coefficient of v_1 , so if you put w equal to $a_1 v_1$ then the coefficient of v_1 will be $b_1 + b a_1$. This is a coefficient of v_1 this is, so coefficient of v_1 is this which should be 0, because a combination is 0, and v_1 to v_n is a basis. Coefficient of v_2 , $b_2 + b a_2$

2 is $b^2 + b a^2$ that is also zero this will go until that a^{k-1} . So, $b^{k-1} + b$ times a^{k-1} is 0 , since coefficient of v^{k-1} coefficient of v^k will be b times a^k this is also 0 . And then again v^k plus onwards same like v^1 to v^{k-1} that is $b^k + 1 + b$ times a^{k+1} , this is 0 and so on coefficient of v^n will be $b^n + b a^n$ is 0 , this is n .

Now, from here we want to conclude all b as 0 and b is also zero, but look at this K th equation that will tell you b is 0 , since a^k nonzero and k is a field that is why field is very, very important because the product of elements is 0 , so and one of them in nonzero. So, the other must be 0 , now $b = 0$, once you go to $b = 0$, then a look at the first equation this part is 0 , so b^1 is 0 . So, second equation $b = 0$, so this is 0 , $k-1$ this equation, this is 0 . So, $b^{k-1} + 0 a^k + 1$ with the equation, this is 0 . So, $b^k + 1$, this is 0 , this is 0 . So, we conclude all b^1, b^2, b^{k-1} are 0 , and b is 0 . So, therefore, from these we have concluded b^1 equal to b^2 etcetera equal to equal to equal to b^{k-1} , they are all 0 . And similarly $b^k + 1, b^k + 2$ etcetera etcetera up to b^n , they are all 0 , so that proves a linear independence of v^1 to v^{k-1} w v^{k+1} to v^n .

So, now, second part we have to check that v^1 to v^{k-1} w v^{k+1} to v^n is a generating system for V . So, this is also very easy because we already know we know already that we know that v^1 to v^{k-1} and v^k, v^{k+1} this is a basis that was given to you, in particular it is a generating system for V . So, to show that this along with w it is a generating system, I only have to check that the vector v^k is a combination of v^1 to v^{k-1} w v^{k+1} and v^n .

(Refer Slide Time: 30:00)

Enough to check that

$$v_k \in \sum_{i=1}^{k-1} K v_i + K w + \sum_{i=k+1}^n K v_i$$

$$w = a_1 v_1 + \dots + a_{k-1} v_{k-1} + a_k v_k + a_{k+1} v_{k+1} + \dots + a_n v_n$$

$a_k \neq 0$, K field, a_k^{-1} exists

$$v_k = a_k^{-1} w - a_k^{-1} (a_1 v_1 + \dots + a_{k-1} v_{k-1} + a_{k+1} v_{k+1} + \dots + a_n v_n)$$

So, to check this, so it is enough to check that vector v_k belongs to the subspace generated by v_i i is from 1 to k minus 1 plus $K w$ plus v_i i is from k plus 1 to n . So, we have to check that this vector v_k has a representation in terms of v_1 to v_{k-1} w and v_{k+1} to v_n , so that is very easy because you know w has a combination like this $a_1 v_1$ etcetera etcetera that is our assumption. This was given to us. And this a_k coefficient is nonzero. So, I will keep this term on one side and remaining terms I will shift it to other side, and multiply by a_k inverse, so multiplying by a_k inverse that is possible because K is a field. So, a_k inverse exists because a_k is nonzero.

And I can rearrange this and rewrite it as. So, I will get an equation v_k will be equal to a_k inverse w minus a_k inverse $a_1 v_1$ plus plus plus plus $a_{k-1} v_{k-1}$ plus $a_{k+1} v_{k+1}$ plus plus plus plus plus $a_n v_n$. So, this gives us an expression for v_k in terms of v_1 to v_{k-1} w and v_{k+1} to v_n . So, that proves that v_1 to v_{k-1} w v_{k+1} to v_n is a generating system for V .

So, we will make a short break and do it after the break.
