Coordinate systems: cylindrical coordinates

Hello everyone, welcome to the lecture again. In the last two lectures, we learned about the Cartesian coordinate, planar polar coordinate, spherical coordinates.

Cylindrical Coordinate $(r, \phi, z) \Rightarrow$

Transformation eqⁿ

$$x = r \cos \phi$$
$$y = r \sin \phi$$
$$z = z$$
$$\vec{R} = x\hat{i} + y\hat{j} + z\hat{k}$$
$$\vec{R} = r \cos \phi \hat{i} + r \sin \phi \hat{j} + z\hat{k} \quad \text{--- (a)}$$
$$\frac{\partial \vec{R}}{\partial z} = \cos \phi \hat{i} + \sin \phi \hat{j} \quad \left| \frac{\partial \vec{R}}{\partial z} \right| = \sqrt{\cos^2 \phi + \sin^2 \phi} = 1 = \hat{z}_1$$
$$\hat{z}_1 = \cos \phi \hat{i} + \sin \phi \hat{j} \quad \text{--- (1)}$$
$$\frac{\partial \vec{R}}{\partial \phi} = -r \sin \phi \hat{i} + r \cos \phi \hat{j} \quad \left| \frac{\partial \vec{R}}{\partial \phi} \right| = r = \hat{r}_1$$
$$\hat{\phi}_1 = -\sin \phi \hat{i} + \cos \phi \hat{j} \quad \text{--- (2)}$$

Today, we are going to study the cylindrical coordinate system. So, cylindrical coordinates, here the axes are r , ϕ and z and let me define them. So, suppose you have again the x -axis, the y -axis and the z -axis and there is a point P which has a coordinate of x , y and z and its position vector is let us say \vec{R} . Then in cylindrical coordinate, you draw a cylinder of radius small r with a height z .

So, let me draw a cylinder of radius small r and its height is z and the angle that this radius vector r makes from the x -axis is your ϕ . So, this angle is ϕ . Therefore, the coordinate of P in the cylindrical coordinate becomes r , ϕ and z . Let me repeat again, r is the radius of the cylinder, ϕ is the angle that this radius vector makes from the x -axis and

z is the height of the cylinder. Now, from the geometry, you can see the transformation equation.

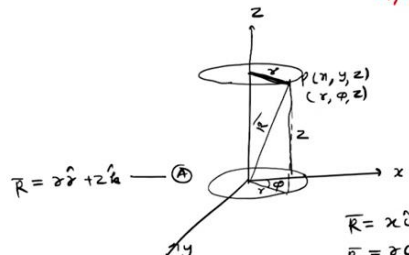

The transformation equations are x is equal to the value of x will be the projection of r along the x-axis. So, that is $r \cos \phi$ the value of y is $r \sin \phi$ and z is z. Therefore, the vector r which is $x\hat{i} + y\hat{j} + z\hat{k}$ I can write down in the cylindrical coordinate system as x is equal to $r \cos \phi \hat{i} + r \sin \phi \hat{j} + z\hat{k}$. Now, as we have done previously, let us look at the unit vector along the r, ϕ and z direction. For that, I have to differentiate this equation with respect to small r, small ϕ and small z. So, let us call it some equation number a and differentiate $\delta R / \delta r$. So, you can see it is $\cos \phi \hat{i} + \sin \phi \hat{j}$.

And what is the value of $|\delta R / \delta r|$ is $\sqrt{\cos^2 \phi + \sin^2 \phi}$ which is equal to 1. Therefore, this becomes our h_1 . Therefore, the unit vector \hat{r} becomes $\cos \phi \hat{i} + \sin \phi \hat{j}$. Let us call it equation number 1. Now, let us calculate $\delta r / \delta \phi$. So, from equation number a, you can see that $\delta r / \delta \phi$ is $-r \sin \phi \hat{i} + r \cos \phi \hat{j}$, which can be written as, so I can take r as a common factor.

This is $-\sin \phi \hat{i} + \cos \phi \hat{j}$. Now, let us see what is $\delta r / \delta \phi$. This is indeed r because the $\sqrt{\cos^2 \phi + \sin^2 \phi} = 1$. So, therefore, this becomes your h_2 and whatever is there in the bracket is your $\hat{\phi}$. So, this is $-\sin \phi \hat{i} + \cos \phi \hat{j}$. Let us call it equation number 2.

Now, let us calculate $\delta r / \delta z$ and from equation number a, it is clear that $\delta r / \delta z$ will be just \hat{k} . So, $\delta r / \delta z$ will be \hat{k} . Therefore, $\delta r / \delta z$ modulus will be 1 and this becomes our h_3 and \hat{z} becomes \hat{k} .

Cylindrical Coordinate $(r, \phi, z) \Rightarrow u_1, u_2, u_3$

$\vec{R} = r\hat{r} + z\hat{k}$ — (A)

$\vec{R} = x\hat{i} + y\hat{j} + z\hat{k}$
 $\vec{R} = r \cos \phi \hat{i} + r \sin \phi \hat{j} + z\hat{k}$ — (B)

$\frac{\partial \vec{R}}{\partial r} = \cos \phi \hat{i} + \sin \phi \hat{j}$ $\left| \frac{\partial \vec{R}}{\partial r} \right| = \sqrt{\cos^2 \phi + \sin^2 \phi} = 1 = h_1$

$\hat{r} = \cos \phi \hat{i} + \sin \phi \hat{j}$ — (1)

$\frac{\partial \vec{R}}{\partial \phi} = -r \sin \phi \hat{i} + r \cos \phi \hat{j}$ $\left| \frac{\partial \vec{R}}{\partial \phi} \right| = r = h_2$
 $= r[-\sin \phi \hat{i} + \cos \phi \hat{j}]$

$\hat{\phi} = -\sin \phi \hat{i} + \cos \phi \hat{j}$ — (2)

Transformation eqⁿ

$x = r \cos \phi$
 $y = r \sin \phi$
 $z = z$

Now, let us look at the differential length, differential area, and differential volume in the cylindrical coordinate system. So, we know the general formula d_1 is $h_1 du_1 \hat{u}_1 + h_2 du_2 \hat{u}_2 + h_3 du_3 \hat{u}_3$, and our $u_1 u_2 u_3$ are $r \phi z$ and h_1, h_2, h_3 is 1, r and 1. So, let us put them in this equation. So, we get d_1, h_1 is 1, u_1 is r , so $dr \hat{r} + h_2$ is r , u_2 is ϕ , so $d\phi \hat{\phi} + h_3$ is 1, and u_3 is z , so $dz \hat{z}$. Therefore, d_1 can be written as $dr \hat{r} + r d\phi \hat{\phi} + dz \hat{z}$. This is the differential length or you can call it the displacement dr . Now, let us look at differential area. Differential area, let us say we are looking in the z direction. So, it will be h_1, du_1, h_2, du_2 and then \hat{u}_3 . Okay. So, h_1 is 1, u_1 is dr , h_2 is r and $d\phi$. So, therefore, it becomes $r dr d\phi$ in the z direction.

Now, the differential volume in cylindrical coordinate system is in $h_1, h_2, h_3 \cdot du_1, du_2, du_3$. And the value of h_1, h_2, h_3 , let us put 1, r , 1 and $dr, d\phi, dz$. So, the volume dv becomes $r, dr, d\phi, dz$. Okay. Now, let us find out the velocity and acceleration in this coordinate system. So, you can see from the figure that vector r can be written as $r \hat{r} + z \hat{k}$ because this r will be this r plus that r from the vector. So, let us call it equation number let us \hat{a}_y and we can find out the velocity by differentiating this with respect to t .

$$\vec{r} = r \hat{r} + z \hat{k} \quad \text{--- (A)}$$

$$v = \frac{d\vec{r}}{dt} = \frac{d}{dt} (r \hat{r} + z \hat{k})$$

$$= \dot{r} \hat{r} + r \dot{\hat{r}} + \dot{z} \hat{k}$$

$$\left[\begin{aligned} \dot{\hat{r}} &= \frac{d}{dt} (\cos \phi \hat{i} + \sin \phi \hat{j}) \\ &= -\sin \phi \dot{\phi} \hat{i} + \cos \phi \dot{\phi} \hat{j} \\ &= \dot{\phi} [-\sin \phi \hat{i} + \cos \phi \hat{j}] \\ &= \dot{\phi} \hat{\phi} \end{aligned} \right]$$

$$v = \dot{r} \hat{r} + r \dot{\phi} \hat{\phi} + \dot{z} \hat{k}$$

$$v = \dot{r} \hat{r} + r \dot{\phi} \hat{\phi} + \dot{z} \hat{k}$$

component along r direction

Coordinate systems:

	u_1	u_2	u_3	h_1	h_2	h_3
Cartesian	x	y	z	1	1	1
Planar Polar	r	ϕ	z	1	r	1
Spherical	r	θ	ϕ	1	$r \sin \theta$	r
Cylindrical	r	ϕ	z	1	r	1

Acc: $a = a_r \hat{r} + a_\phi \hat{\phi} + a_z \hat{k}$
 where,
 $a_r = \ddot{r} - r \dot{\phi}^2$
 $a_\phi = r \ddot{\phi} + 2 \dot{r} \dot{\phi}$
 $a_z = \ddot{z}$

So, let us do that. So, as we said vector r is $r, \hat{r} + z \hat{k}$. This is equation number a. So, velocity v is nothing but dr/dt and it will be $d/dt \vec{r}$ is $r, \hat{r} + z \hat{k}$.

So, let us differentiate this. So, we have $r, \hat{r} + \dot{r} \hat{r}$ and k is constant. So, therefore, it will be just $\dot{z} \hat{k}$. Now, as earlier, we have to find out what is the derivative of \hat{r} . So, let us look

at the derivative of \hat{r} , this is nothing but d/dt of \hat{r} and \hat{r} . We have already find out from equation number a, it is $\cos\phi i + \sin\phi j$. So, let us look at the derivative, it will be $-\sin\phi\dot{\phi}i + \cos\phi\dot{\phi}j$ and I can take $\dot{\phi}$ outside. So, it becomes $-\sin\phi i + \cos\phi j$ and this is the value of $\hat{\phi}$. Let us look at equation number 2. So, this becomes $\hat{\phi}\dot{\phi}$.

Let us put this in the above equation. So, we have $v = r\dot{\phi}\hat{\phi} + \dot{r}\hat{r} + \dot{z}\hat{k}$ or we can write down $v = \dot{r}\hat{r} + r\dot{\phi}\hat{\phi} + \dot{z}\hat{k}$. This is the expression for the velocity in cylindrical coordinate system.

So, \dot{r} is the component along r direction and similarly $r\dot{\phi}$ is the velocity component along $\hat{\phi}$ direction and \dot{z} is of course the velocity along the k direction. Now, this is your homework problem to find out the acceleration I am giving you the final answer. The acceleration a , let us say it is written in this form $a_r\hat{r} + a_\phi\hat{\phi} + a_z\hat{z}$. Then the value of a_r will be $r\ddot{r} - r\dot{\phi}^2$. a_ϕ will be $r\ddot{\phi} + 2\dot{r}\dot{\phi}$ and $a_z = \ddot{z}$.

So, these are the component along the i direction, this is the component of the acceleration along the ϕ direction and of course, this is the component of the acceleration along the z direction. Now, let me summarize the result that we have obtained so far. So, we studied various coordinate systems. We studied the Cartesian coordinate. Planar polar coordinate, spherical coordinate and today we studied the cylindrical coordinate.

We used u_1, u_2, u_3, h_1, h_2 And h_3 , where u_1, u_2, u_3 are the coordinates and h_1, h_2 and h_3 are the scale factors. So, everything can be written down in this term. For Cartesian coordinate, u_1 was x, u_2 was y, u_3 was z, and h_1, h_2, h_3 were 1, 1, 1. The planar polar coordinate system was defined on two dimensions.

Therefore, there was no u_3 . We have r and θ and h_1 and h_2 were 1 and r. For a spherical coordinate system, we have r, θ and ϕ and h_1, h_2, h_3 were 1, r, r sin theta. In the cylindrical coordinate system, it was r, ϕ and z and h_1, h_2 and h_3 were 1, r and 1.

Q.1 ⇒ Given Point $P(-2, 6, 3)$. Evaluate P in spherical & cylindrical coordinate system.

$$\begin{aligned} r &= \sqrt{x^2 + y^2 + z^2} & \theta &= 7 \\ \theta &= \tan^{-1} \frac{\sqrt{x^2 + y^2}}{z} & \phi &= 64.62^\circ \\ \phi &= \tan^{-1} \frac{y}{x} & \phi &= 108.43^\circ \\ P &= (7, 64.62, 108.43) \end{aligned}$$

$$\begin{aligned} \rho &= \sqrt{x^2 + y^2} & = & 6.32 \\ \phi &= \tan^{-1} \frac{y}{x} & = & 108.43^\circ \\ z &= z & = & 3 \end{aligned}$$

$$P(6.32, 108.43^\circ, 3) \quad \underline{\underline{\Delta}}$$

Now, let us look at a very simple example and the problem statement is following. Given point P equal to $-2, 6, 3$, evaluate P in spherical and cylindrical coordinate system. So, the point is given in Cartesian coordinate. So, let me make the Cartesian coordinate x , y and z and let us say the point P is here $-2, 6, 3$. Then, in a spherical coordinate system, you have the coordinates r , θ and ϕ . So, let us say this is r and the angle that this r is making from the z axis is θ and its projection that makes the angle from the x axis is ϕ .

So, from the geometry, you can see that r is $\sqrt{x^2 + y^2 + z^2}$. θ is $\tan^{-1} \sqrt{x^2 + y^2 + z^2}$, and ϕ is $\tan^{-1} \frac{y}{x}$. Now, since the value of x , y , and z is given here, so you can put it in these equations. You will get $r = 7$.

Theta is equal to 64.5° and $\phi = 108.43^\circ$. Therefore, in a spherical coordinate system, the coordinate of point P is $7^\circ, 64.62^\circ$ and 108.43° . Now, let us represent this point P in cylindrical coordinate system. You know in cylindrical coordinate system, the coordinates are r , ϕ and z where r is the radius of the cylinder and ϕ is the angle that this radius vector makes from the x -axis and z is the height of the cylinder. So, you can see from the figure that ρ is $\sqrt{x^2 + y^2}$. ϕ is $\tan^{-1} \left(\frac{y}{x}\right)$ and z is z . Now, x , y and z is given. They are minus 2, 6 and 3.

Therefore, rho you can calculate. It comes out to be 6.32. ϕ Comes out to be 108.43° and z is of course 3° . Therefore, in cylindrical coordinate system, the point P becomes $6.32^\circ, 108.43^\circ$ and 3° .

Q.2 \Rightarrow Express the vector $\vec{A} = r z \sin \phi \hat{a}_r + 3r \cos \phi \hat{a}_\phi + r \cos \phi \sin \phi \hat{a}_z$ in Cartesian coordinate.

Ans: $\vec{A} = r z \sin \phi \hat{a}_r + 3r \cos \phi \hat{a}_\phi + r \cos \phi \sin \phi \hat{a}_z$
 $\vec{A} = A_x \hat{a}_x + A_y \hat{a}_y + A_z \hat{a}_z$

$\vec{A} = A_x [\cos \phi \hat{a}_x + \sin \phi \hat{a}_y] + A_y [-\sin \phi \hat{a}_x + \cos \phi \hat{a}_y] + A_z \hat{a}_z$
 $= \hat{a}_x [A_x \cos \phi - A_y \sin \phi] + \hat{a}_y [A_x \sin \phi + A_y \cos \phi] + A_z \hat{a}_z$
 $= \hat{a}_x [r z \sin \phi \cos \phi - 3r \cos \phi \sin \phi]$
 $\quad + \hat{a}_y [r z \sin^2 \phi + 3r \cos^2 \phi]$
 $\quad + r \cos \phi \sin \phi \hat{a}_z$ — (1)

Transformation eqⁿ :-
 $r = \sqrt{x^2 + y^2}$
 $\tan \phi = \frac{y}{x}$, $\sin \phi = \frac{y}{\sqrt{x^2 + y^2}}$, $\cos \phi = \frac{x}{\sqrt{x^2 + y^2}}$
 $z = z$

$r z \sin \phi \cos \phi - 3r \cos \phi \sin \phi$
 $= \left(\frac{\sqrt{x^2 + y^2}}{\sqrt{x^2 + y^2}} \cdot z \cdot \frac{y}{\sqrt{x^2 + y^2}} \cdot \frac{x}{\sqrt{x^2 + y^2}} \right) - \left(3 \cdot \frac{\sqrt{x^2 + y^2}}{\sqrt{x^2 + y^2}} \cdot \frac{x}{\sqrt{x^2 + y^2}} \cdot \frac{y}{\sqrt{x^2 + y^2}} \right)$
 $= \frac{x y z - 3 x y}{\sqrt{x^2 + y^2}}$

Now, let us look at one more problem statement. Question number 2. Express the vector which is given as $rz\sin\phi\hat{a}_r + 3r\cos\phi\hat{a}_\phi + r\cos\phi\sin\phi\hat{a}_z$ in Cartesian coordinate. So, note that this vector is given in terms of A_r, A_ϕ and A_z . Therefore, this is written in the cylindrical coordinate system. So, we have x-axis, y-axis and z-axis and in cylindrical coordinate, you have r which is the radius of the cylinder, its height z and then ϕ is the angle that this r makes from the x-axis.

So, this is your ϕ . So, vector A is given as $rz\sin\phi\hat{a}_r + 3r\cos\phi\hat{a}_\phi + r\cos\phi\sin\phi\hat{a}_z$. Now, in general, a cylindrical coordinate, a vector A is written as $A_r\hat{r} + A_\phi\hat{\phi} + A_z\hat{z}$, where A_r is $rz\sin\phi$, A_ϕ here is $3r\cos\phi$ and A_z is $r\cos\phi\sin\phi$.

So, we know the value of $\hat{r}\hat{\phi}$ and \hat{z} in Cartesian coordinate. So, therefore, this A I can write down as $A_r\hat{r}$ is $\cos\phi\hat{a}_x + \sin\phi\hat{a}_y$ plus the value of $\hat{\phi}$ is $-\sin\phi\hat{a}_x + \cos\phi\hat{a}_y + A_z\hat{z}$. I can collect the coefficient of $\hat{a}_x, \hat{a}_y,$ and \hat{A}_z . So, this I can write down as $\hat{a}_x[A_r\cos\phi - A_\phi\sin\phi] + \hat{a}_y[A_r\sin\phi + A_\phi\cos\phi] + A_z\hat{z}$. Now, the value of A_r is already known. It is $rz\sin\phi$. Therefore, I can write it as $\hat{a}_x. rz\sin\phi$ And $\cos\phi - A_\phi$ is also known.

It is $3r\cos\phi$. So, this will be $-3r\cos\phi\sin\phi + \hat{a}_y rz\sin^2\phi + 3r\cos^2\phi$ plus A_z is $r\cos\phi\sin\phi\hat{z}$. Let us call this equation number 1. Now, what I have to do is I have to write down this r, z and ϕ in terms of the, you know, Cartesian coordinate.

So, for that we have the transformation equation. The transformation equation from cylindrical to Cartesian coordinate is $r = \sqrt{x^2 + y^2}$. This you can see from the geometry and ϕ or $\tan\phi$ is y/x and z remains z. So, if $\tan\phi$ is y/x and we need what is the value of $\sin\phi$ and $\cos\phi$, so that we can find out. So, $\sin\phi$ will be $y/\sqrt{x^2 + y^2}$ and $\cos\phi$ therefore, will be $x/\sqrt{x^2 + y^2}$.

Now, all these transformation I can put in equation number 1. So, let us look at the first term, the coefficient of \hat{a}_x . The coefficient of \hat{a}_x is $rz\sin\phi\cos\phi - 3r\cos\phi\sin\phi$. So, let us put the values r is $\sqrt{x^2 + y^2}$, z is z and $\sin\phi$ is $y/\sqrt{x^2 + y^2}$ and $\cos\phi$ is $x/\sqrt{x^2 + y^2}$. This is $r z\sin\phi\cos\phi$ minus 3, r is $\sqrt{x^2 + y^2}$ into $\cos\phi$ is $x/\sqrt{x^2 + y^2}$ and $\sin\phi$ is $y/\sqrt{x^2 + y^2}$. So, this square root will get cancelled with this and this will get cancelled with that. So, I can write down this as $xyz - 3xy/\sqrt{x^2 + y^2}$. This is the first term. The coefficient of \hat{a}_y . Similarly, we can find out the coefficient of \hat{a}_y . So, which is $r, z\sin^2\phi + 3r\cos^2\phi$. So, let us find out that. So, we have r, $z\sin^2\phi + 3r\cos^2\phi$. So, again r is $\sqrt{x^2 + y^2}$, z is as it is. And $\sin^2\phi$ is $y^2/\sqrt{x^2 + y^2}\sqrt{x^2 + y^2}$. Okay.

So, this is your r, $z\sin^2\phi$ plus 3r is $\sqrt{x^2 + y^2}$ and $\cos\phi$ is $\frac{x^2}{\sqrt{x^2+y^2}\sqrt{x^2+y^2}}$. So, again this

$$\begin{aligned}
 & * r z \sin^2 \phi + 3 r \cos^2 \phi \\
 & \Rightarrow \left[\frac{\sqrt{x^2+y^2} \cdot z \cdot \frac{y^2}{\sqrt{x^2+y^2}}}{\sqrt{x^2+y^2}} \right] + \left[3 \cdot \frac{\sqrt{x^2+y^2} \cdot \frac{x^2}{\sqrt{x^2+y^2}}}{\sqrt{x^2+y^2}} \right] \\
 & \Rightarrow \frac{y^2 z + 3x^2}{\sqrt{x^2+y^2}} \\
 & * r \cos \phi \sin \phi \\
 & \Rightarrow \frac{\sqrt{x^2+y^2} \cdot \frac{x}{\sqrt{x^2+y^2}} \cdot \frac{y}{\sqrt{x^2+y^2}}}{\sqrt{x^2+y^2}} = \frac{xy}{\sqrt{x^2+y^2}} \quad \text{put in } \textcircled{1} \\
 & A = \hat{a}_x \left[\frac{xyz - 3xy}{\sqrt{x^2+y^2}} \right] + \hat{a}_y \left[\frac{y^2 z + 3x^2}{\sqrt{x^2+y^2}} \right] + \hat{a}_z \left[\frac{xy}{\sqrt{x^2+y^2}} \right] \quad \textcircled{1}
 \end{aligned}$$

square root will cancel with this and this will get cancelled with that. So, therefore, we are left with $y^2 z + 3x^2/\sqrt{x^2 + y^2}$.

Now, let us look at the coefficient of \hat{z} , which is $r\cos\phi\sin\phi$. So, now, we are looking for $r\cos\phi\sin$. So, r is $\sqrt{x^2 + y^2}$ $\cos\phi$ is $x/\sqrt{x^2 + y^2}$ and $\sin\phi$ is $y/\sqrt{x^2 + y^2}$. This will get cancelled with that. So, we are left with $xy/\sqrt{x^2 + y^2}$.

So, now we have the coefficient of \hat{a}_x, \hat{a}_y and \hat{a}_z . Therefore, we can put that in equation number 1. So, we get \hat{a}_x and then the coefficient $\hat{a}_x \left[\frac{xyz - 3xy}{\sqrt{x^2 + y^2}} \right] + \hat{a}_y \left[\frac{y^2 z + 3x^2}{\sqrt{x^2 + y^2}} \right] + \hat{a}_z \left[\frac{xy}{\sqrt{x^2 + y^2}} \right]$. So with this, let me stop here. See you in the next class.

Thank you.
