The image shows a handwritten derivation in a Notepad window. On the left side, the following steps are shown:

$$\int_V \sum_n \nabla^2 \psi_n(\vec{x}) \cdot a_n(\omega) \psi_p(\vec{x}) dV + \int_V k^2 \sum_n \psi_n(\vec{x}) a_n(\omega) \psi_p(\vec{x}) dV$$

$$= \int_V j\omega \rho_0 S(\vec{x}, \omega) \psi_p(\vec{x}) dV + \int_{S_f} j\omega \rho_0 U(\vec{y}, \omega) \psi_p(\vec{y}) dS$$

$$\int_V \sum_n -k_n^2 a_n(\omega) \psi_n(\vec{x}) \psi_p(\vec{x}) dV + \int_V k^2 \sum_n a_n(\omega) \psi_n(\vec{x}) \psi_p(\vec{x}) dV$$

On the right side, the derivation continues with:

$$-k_n^2 V a_n(\omega) + k^2 V a_n(\omega)$$

$$= \int_V j\omega \rho_0 S(\vec{x}, \omega) \psi_p(\vec{x}) dV + \int_{S_f} j\omega \rho_0 U(\vec{y}, \omega) \psi_p(\vec{y}) dS$$

$$a_n(\omega) = \frac{j\omega \rho_0}{V [k^2 - k_n^2]} \left\{ \int_V + \int_{S_f} \right\}$$

$$k^2 = \frac{\omega^2}{c_0^2} \quad k_n^2 = \frac{\omega_n^2}{c_s^2}$$

$$a_n(\omega) = \frac{j\omega \rho_0 e_0^2}{V [\omega^2 - \omega_n^2]} \left\{ \int_V + \int_{S_f} \right\}$$

There are some handwritten notes in red on the right side:  $p = \sum_n a_n \psi_n$ ,  $i_p$ , and  $i_n = \psi_n$ .

Good morning welcome to this next lecture on sound and structural vibration. See we ended up last time looking at this equation here I have

$$\int \sum_n \nabla^2 \psi_n(\vec{x}) a_n(\omega) \psi_p(\vec{x}) dV$$

$$+ \int k^2 \sum_n \psi_n(\vec{x}) a_n(\omega) \psi_p(\vec{x}) dV = \int j\omega \rho_0 S(\vec{x}, \omega) \psi_p(\vec{x}) dV$$

$$+ \int j\omega \rho_0 U(\vec{y}, \omega) \psi_p(\vec{y}) dS.$$

So, now I am going to use what I showed last time the operation on del square gives me minus. So, I have

$$\int \sum_n -k_n^2 a_n(\omega) \psi_n(\vec{x}) \psi_p(\vec{x}) dV + \int k^2 \sum_n a_n(\omega) \psi_n(\vec{x}) \psi_p(\vec{x}) dV$$

The other side there is not much of a change. So, let us look at this part. So, the right-hand side does not much of change. So, let us look at this part. So, now I will get this integral over  $\psi_n(\vec{x})$  and  $\psi_p(\vec{x})$  if I use orthogonality, it will be 0 if  $n$  is not equal to  $p$ . So, out of the sum only one

fellow is picked out same here this is 0 if  $n$  and  $p$  are not equal therefore again only one term is picked up.

So, that becomes equal to  $-k_n^2 V a_n(\omega)$  integral gives me the volume back and then I get an  $a_n(\omega)$  and this  $k$  is the forcing  $k$ . Now you should remember that this  $k$  is not the homogeneous  $k$  this  $k$  is the forcing  $k$ . So, this will be  $k^2 V a_n(\omega)$  and the other side is what? Now let me just repeat it, it is  $\int j\omega\rho_0 S(\vec{x}, \omega) \psi_p(\vec{x}) dV + \int j\omega\rho_0 U(\vec{y}, \omega) \psi_p(\vec{y}) dS$ .

$$-k_n^2 V a_n(\omega) + k^2 V a_n(\omega) = \int j\omega\rho_0 S(\vec{x}, \omega) \psi_p(\vec{x}) dV + \int j\omega\rho_0 U(\vec{y}, \omega) \psi_p(\vec{y}) dS.$$

So, now we want  $a_n$ . So, we should not forget what the unknown pressure is, was what a summation over  $a_n \psi_n$ ,  $\psi_n$  are the known mode shape shapes  $a_n$  is the unknown. So, we want  $a_n$ . Similarly, we want  $b_m$  because  $\phi_m$  are known mode shapes we want  $b_m$ . So, now what do we have we have  $a_n$  which I want that is equal to  $\frac{j\omega\rho_0}{V[k^2 - k_n^2]} \{ \int dV + \int dS \}$ .

We will also do one more thing  $k^2$  is of course  $\frac{\omega^2}{c_0^2}$  the forcing frequency  $\omega$ ,  $k_n^2$  we will write it as  $\frac{\omega_n^2}{c_0^2}$  which is now the natural frequency of the  $n$ th mode by  $c_0^2$ , so, one more time

$$a_n(\omega) = \frac{j\omega\rho_0 c_0^2}{V[\omega^2 - \omega_n^2]} \left\{ \int dV + \int dS \right\}.$$

So, there is a compact notation.

**(Refer Slide Time: 08:49)**

The image shows a Notepad window with handwritten mathematical derivations for acoustic modal analysis. The derivations are as follows:

- $$A_n(\omega) = \frac{1}{V \tau_a + j\omega} \quad n=1$$

$$= \frac{j\omega}{\omega_n^2 - \omega^2 + j 2\zeta_n \omega_n \omega} \quad n \neq 1.$$
- $$\underline{a}_n(\omega) = \frac{\rho_0 c_0^2}{V} \underline{A}_n(\omega) \left[ \underline{q}_n + \sum_{m=1}^M C_{nm} \underline{b}_m(\omega) \right]$$
- $$\underline{q}_n = \int_V S(\vec{x}, \omega) \psi_n(\vec{x}) dV$$
- $$\int U(\vec{y}, \omega) \psi_n(\vec{y}) dV$$

$$\int \sum \phi_m(\vec{y}) \underline{b}_m(\omega) \cdot \psi_n(\vec{y}) dS$$
- $$C_{n,m} = \int_{S_f} \psi_n(\vec{y}) \phi_m(\vec{y}) dS.$$
- $$\sum_{m=1}^M C_{nm} \underline{b}_m$$
- $$\underline{\bar{a}} = \underline{\bar{Z}}_a (\underline{\bar{q}}_f + \underline{\bar{q}}_s)$$

$\underline{\bar{q}}_f = N \times 1$  Acoustic modal

$\underline{\bar{q}}_s = \underline{\bar{C}} \underline{\bar{b}}$  Source Vect. plate force

$\underline{\bar{Z}}_a = \underline{\bar{A}} + \underline{\bar{C}}_a$ ,  $N \times N$  diagonal UnCoupled Acoustic modal Imp. Matrix.

Now possible we will write

$$A_n(\omega) = \frac{1}{\frac{1}{T_a} + j\omega}$$

This is  $n$  equal to one the rigid body mode it does not have a natural frequency, but it just has a relaxation time. Then we have the other as  $\frac{j\omega}{\omega_n^2 - \omega^2 + j2\zeta_n\omega_n\omega}$ , this is for  $n$  not equal to 1.

So, what does  $a_n$  becomes in some compact form

$$a_n(\omega) = \frac{\rho_0 c_0^2}{V} A_n(\omega) \left[ q_n + \sum_{n=1}^M C_{nm} b_m(\omega) \right]$$

where what have we done what we have done is first of all  $q_n$  is of course the integral over the volume of the source with a particular motor shape there are  $n$  of this.

$$q_n = \int S(\vec{x}, \omega) \psi_n(\vec{x}) dV.$$

So, it is kind of the modal forcing factor modal volume velocity factor may be how much of this source contributes to a particular mode on top of that we have the second integral was the integral of the velocity again multiplied by  $\psi$  at the panel surface.

So, this we replace with  $\int \sum \phi_m(\vec{y}) b_m(\omega) \psi_n(\vec{y}) ds$ . So, it is now an integral of one type of mode shape with the acoustic mode shape at the plate surface. So, this now is there are  $m$  of these there are  $n$  of these. So, it is now in there are  $n$  into  $m$  elements. Now there are  $n$  into  $m$  elements. So, that is given the nomenclature  $C_{nm}$  is equal to  $\int \psi_n(\vec{y}) \phi_m(\vec{y}) ds$ . So, it is now an  $n$  cross  $m$  matrix it is an  $n$  cross  $m$  matrix.

So, what is that term? Now so, this term ends up looking like a  $\sum_{m=1}^M C_{nm} b_m$ . So, here  $m$  is equal to 1 to capital  $M$  the single  $n$  mode coupling to several  $m$  modes. So, this is there are  $m$  of this. So, that is your  $C_{nm} b_m$  in a further compact notation we will write it as

$$\vec{a} = \vec{Z}_a (\vec{q} + \vec{q}_s).$$

So, this  $\vec{q}$  is an  $N$  cross one acoustic modal source vector and whereas  $\vec{q}_s$  is the same given by  $C_{N \times M} b_{M \times 1}$  panel or plate force modal source vector this is  $N$  cross  $M$  and this is  $M$  cross 1.

So, it is easy to easy to understand and what is  $\vec{Z}_a$ ?  $\vec{Z}_a$  is  $\frac{\vec{A} \rho_0 c_0^2}{V}$ ,  $\vec{Z}_a$  is an  $N$  cross  $N$  is called the diagonal uncoupled acoustic modal impedance matrix. So, we have arrived it at the acoustic amplitudes in terms of the other forces and then the acoustic amplitude contains  $b$  which is also an unknown. So, we have to formulate a second equation what is the second equation?

(Refer Slide Time: 18:42)

The image shows a handwritten derivation in a Notepad window. On the left side, the structural equation is written as:

$$D \left[ \frac{\partial^4 W(x,y,t)}{\partial x^4} + \frac{2\partial^4 W(x,y,t)}{\partial x^2 \partial y^2} + \frac{\partial^4 W(x,y,t)}{\partial y^4} \right] + m' \frac{\partial^2 W(x,y,t)}{\partial t^2} = \bar{f}(x,y,\omega) - \bar{p}(x,y,\omega)$$

Below this, the Laplace transform is applied to the displacement  $W(\vec{y}, \omega)$  and velocity  $U(\vec{y}, \omega)$ :

$$L W(\vec{y}, \omega) + m' \frac{\partial^2 W(\vec{y}, \omega)}{\partial t^2} = j\omega \bar{f}(\vec{y}, \omega) - \bar{p}(\vec{y}, \omega) j\omega$$

On the right side, the modal expansion of the displacement is given as:

$$U(\vec{y}, \omega) = \sum_{m=1}^M b_m \phi_m$$

The derivation then shows the expansion of the structural equation using the modal functions  $\phi_m$  and the resulting equations for the modal coefficients  $b_m$ .

It is the structural equation the structural equation what is that structural equation to begin with there is. So, just for the plate suppose I show you what it is for a plate some

$$D \left[ \frac{\partial^4 W(x, y, t)}{\partial x^4} + \frac{2\partial^4 W(x, y, t)}{\partial x^2 \partial y^2} + \frac{\partial^4 W(x, y, t)}{\partial y^4} \right] + m' \frac{\partial^2 W(x, y, t)}{\partial t^2}$$

So, we will say we have an operator that is acting on my plate  $LW(\vec{y}, \omega) + m' \frac{\partial^2 W(\vec{y}, \omega)}{\partial t^2}$ . So, now there is a force applied to it force applied to it over  $y$  and force is force per unit area units that you should know. Now and here is the crux we showed you I mean I showed you in the very beginning how the pressure due to a volume velocity can generate a velocity opposed to what the force generates.

So, here I choose minus the pressure from the cavity acting on the panel. This is the one of the issues that one should remember in structure sound structure interaction problems.

$$LW(\vec{y}, \omega) + m' \frac{\partial^2 W(\vec{y}, \omega)}{\partial t^2} = f(\vec{y}, \omega) - p(\vec{y}, \omega)$$

So, now I will we are doing everything in terms of velocity. So, we will do that. So, if we do that in velocities

$$LU(\vec{y}, \omega) + m' \frac{\partial^2 U(\vec{y}, \omega)}{\partial t^2} = j\omega f(\vec{y}, \omega) - p(\vec{y}, \omega) j\omega$$

Now let us go back to using our modal sum the  $U(\vec{y}, \omega)$  is a modal sum with  $m$  going from 1 to capital  $M$  this time.

$$U(\vec{y}, \omega) = \sum_{m=1}^M b_m \phi_m$$

So, now if you substitute is this, I have this

$$\sum_{m=1}^M L \phi_m(\vec{y}) b_m(\omega) - m' \omega^2 \sum b_m \phi_m = j\omega f(\vec{y}, \omega) - p(\vec{y}, \omega) j\omega.$$

$$\sum_{m=1}^M L \phi_m(\vec{y}) b_m(\omega) - m' \omega^2 \sum b_m \phi_m = j\omega f(\vec{y}, \omega) - j\omega \sum a_n(\omega) \psi_n(\vec{y}).$$

So, now what happens we perform this  $L$  operator on  $\phi_m$  and what that does is I should get

$$\sum_{m=1}^M m' \omega_m^2 \phi_m(\vec{y}) b_m(\omega) - m' \omega^2 \sum_{m=1}^M b_m \phi_m = j\omega f(\vec{y}, \omega) - j\omega \sum_{n=1}^N a_n(\omega) \psi_n(\vec{y}).$$

Now we multiply this we are running out of time I will stop the lecture here we will continue from here the next class.
