Lecture 4
Module 1
Equation of continuity in cylindrical coordinate system

Hello, we you remember that in the last class we had said that we are doing with Cartesian coordinate that is x, y, z . Now this time we will be doing with the cylindrical coordinate that is r, θ, z , right?

(Refer Slide Time: 0:46)

With that we will do, so let us look into so un unlike the previous one where we had said that x, y, z was the coordinate here we take some cylindrical coordinate like this and, right? And okay so this can be del theta, this can be del r and this is del z, right? So in the coordinate system we have r theta z so this is z, this is theta and this is r.

So if we take r theta z coordinate, then here we are taking this point as the r theta z coordinate, right? And in the previous one if you remember where we had said let me just recapitulate where we had said that we were taking a volume element at the center, right? We said if this is going like this and that is going like that so how much mass is coming here we took it as the balancing point. So here in this case if we take this balancing point to be at the r theta z point, right?

Then, this is of course r plus delta r, this is r plus delta r, this is theta plus del theta and this is z plus del z only one thing which is we are taking that area under this and area under this they are though there is a difference because in all the cases this will be all difference and in that case we will take this is z plus delta z, right? And this also will be different, this also will be r plus del r so all the changes whatever since we have said we are taking the volume element very small as small as possible.

So those changes will be ignoring, otherwise this will become too complicated so just to avoid the complication we are assuming that this area under this and the area under this they are more or less same. So the changes with that del quantity r plus del r or theta plus del theta or z plus del z this we are neglecting for the upper one, right? So if the on the similar fashion as we have done

in the Cartesian coordinate so if we do for the cylindrical coordinate in the same way, then we can write in in the phase r , right? in in the phase r that is $m \cdot r$ into $\text{del } r$ (ra) or $\text{del } a$ rather area $\text{del } a$ so which is $m \cdot r$ into the area is which one in the if this is r , right?

So $r \text{ del } \theta \text{ del } z$ $r \text{ del } \theta \text{ del } z$ is the area $r \text{ del } \theta \text{ del } z$, so $\text{del } z$ is this, right? And this one will be $r \text{ plus } \text{del } r$ but this is $\text{del } \theta \text{ plus } \text{del } \theta$, right? So the phase which is having the area $r \text{ del } \theta \text{ del } z$ r is this arc, right? This arc $r \text{ del } \theta$ is that and we can say that here it is $m \cdot r$ $r \text{ del } \theta \text{ del } z$, right? So now $m \cdot r$ was what? $\rho \text{ vr}$ into $r \text{ del } \theta \text{ del } z$, right? So this was in so out r or $r \text{ plus } \text{del } r$ so out $r \text{ plus } \text{del } r$ is at this point or at this point in this plain that will be equals to $m \cdot r \text{ plus } \text{del } \text{del } r$ out $m \cdot r$, right? Into the entire $\text{del } r$, right?

$\text{del } \text{del } r$ of $m \cdot r$ into entire $\text{del } r$, right? Into the area, area is $r \text{ plus } \text{del } r$ into $\text{del } \theta$ into $\text{del } z$ $r \text{ plus } \text{del } r \text{ del } \theta \text{ del } z$, right? So this on simplification we can write that this is nothing but $\rho \text{ vr } r \text{ del } \theta \text{ del } z \text{ plus } \rho \text{ vr } \text{del } r \text{ del } \theta \text{ del } z \text{ plus } \text{del } \text{del } r$ of $\rho \text{ vr } r \text{ del } r \text{ del } \theta \text{ del } z$, right? So we can say that in was like that earlier and in minus out if then we can write in minus out to be equals to $\rho \text{ vr } r \text{ del } \theta \text{ del } z \text{ minus } \rho \text{ vr } r \text{ del } \theta \text{ del } z$, right? Minus $\rho \text{ vr } \text{del } r \text{ del } \theta \text{ del } z \text{ minus } \text{del } \text{del } r$ of $\rho \text{ vr}$, right? Into $r \text{ del } \theta \text{ del } z \text{ del } r$.

So this on simplification gives us minus $\rho \text{ vr } \text{del } r \text{ del } \theta \text{ del } z \text{ minus } \text{del } \text{del } r$ of $\rho \text{ vr } r \text{ del } r \text{ del } \theta \text{ del } z$, right? So this we can say in the previous class we had said that we expanded in the $(\text{()})_{(9:28)}$ method we expanded $\rho \text{ v}$, right? Keeping v constant ρ we varied keeping ρ constant we varied v if you remember that $\text{del } \text{del } r$ of $\rho \text{ vr}$ that how can we expand it. So here also we can expand it or we have already expanded form which if we do the other way then it we can make them as the compact one like this that this is equals to minus $\text{del } \text{del } r$ of $r \text{ rho vr}$ into $\text{del } r \text{ del } \theta \text{ del } z$, how?

If we expand this $\text{del } \text{del } r$ of $r \text{ rho vr}$ if we expand this and take this $\rho \text{ vr}$ and r as the uv product, right? As the product both r into $\rho \text{ vr}$ if we take this as product then in one case r is constant, right? In one case r is constant, then it is (ex) on expansion it is (cam) coming r , right? Obviously in both the cases a negative sign is there, so in one case it will be $r \text{ del } r$, right? $\rho \text{ vr } \rho \text{ vr } \text{del } \text{del } r$ of $\rho \text{ vr } r \text{ del } r \text{ del } \theta \text{ del } z$, right?

And in other case this $\text{del } \text{del } r$ of $\rho \text{ vr}$ is differentiated or rather this is one uv expansion and the other one if $\rho \text{ vr}$ is constant, then $\text{del } \text{del } r$ of r is one so in that case $\rho \text{ vr } \text{del } r \text{ del } \theta$

del z that becomes so on. So this is u and this is say v if we make uv that del del of something of uv that expansion method if we apply here then that expanded form is like this which on which on clubbing we get r rho vr as the variable and del del r of r rho vr del r del theta del z is the in minus out of course with a negative, right?

(Refer Slide Time: 12:47)

$$\begin{aligned} \text{in-mt}/r &= -\frac{\partial}{\partial r} (r\rho v_r) \delta r \delta \theta \delta z \\ \text{in-mt}/\theta &= \rho v_\theta r \delta r \delta z - \left(\rho v_\theta + \frac{\partial(\rho v_\theta)}{\partial \theta} \right) \delta r \delta z \\ &= -\frac{\partial(\rho v_\theta)}{\partial \theta} \delta \theta r \delta z \\ \text{in}_z &= \rho v_z r \delta \theta \delta r \\ \text{out}_r &= \rho v_r + \left(\frac{\partial}{\partial r} (\rho v_r) \delta r \right) r \delta \theta \delta z \\ \text{in}_\theta - \text{mt}_\theta &= -\frac{\partial}{\partial \theta} (\rho v_\theta) r \delta r \delta z + \frac{\partial(\rho v_\theta)}{\partial \theta} \delta \theta r \delta z \\ \text{Add up } r, \theta, z &= -\left[\frac{\partial}{\partial r} (r\rho v_r) \delta r \delta \theta \delta z + \frac{\partial}{\partial \theta} (\rho v_\theta) r \delta r \delta z \right] + \frac{\partial(\rho v_z)}{\partial t} \delta \theta r \delta z \\ \text{Accumulation} &= \left(\frac{\partial \rho}{\partial t} \right) r \delta r \delta \theta \delta z \end{aligned}$$

$$\begin{aligned} \text{in-mt}/r &= -\frac{\partial}{\partial r} (r\rho v_r) \delta r \delta \theta \delta z \\ \text{in-mt}/\theta &= \rho v_\theta r \delta r \delta z - \left(\rho v_\theta + \frac{\partial(\rho v_\theta)}{\partial \theta} \right) \delta r \delta z \\ &= -\frac{\partial(\rho v_\theta)}{\partial \theta} \delta \theta r \delta z \\ \text{in}_z &= \rho v_z r \delta \theta \delta r \\ \text{out}_r &= \rho v_r + \left(\frac{\partial}{\partial r} (\rho v_r) \delta r \right) r \delta \theta \delta z \\ \text{in}_\theta - \text{mt}_\theta &= -\frac{\partial}{\partial \theta} (\rho v_\theta) r \delta r \delta z + \frac{\partial(\rho v_\theta)}{\partial \theta} \delta \theta r \delta z \\ \text{Add up } r, \theta, z &= -\left[\frac{\partial}{\partial r} (r\rho v_r) \delta r \delta \theta \delta z + \frac{\partial}{\partial \theta} (\rho v_\theta) r \delta r \delta z \right] + \frac{\partial(\rho v_z)}{\partial t} \delta \theta r \delta z \\ \text{Accumulation} &= \left(\frac{\partial \rho}{\partial t} \right) r \delta r \delta \theta \delta z \\ \text{mass in} - \text{mass out} &= \text{Accumulation} \\ \frac{\partial \rho}{\partial t} + \frac{\partial}{\partial r} (r\rho v_r) + \frac{\partial}{\partial \theta} (\rho v_\theta) + \frac{\partial(\rho v_z)}{\partial t} &= 0 \end{aligned}$$

So similarly we can say for the other two cases that in minus out for this in minus out for r coordinate we can write that this is nothing but minus del del r of r rho vr into del r del theta del z. So in similar way exactly in a similar way we can also write in minus out that is mass flow in minus mass flow out at the coordinate theta, then we get similar to that okay let us do this way

that in minus out this way in will be $\rho v_\theta r \, dr \, dz - \rho v_\theta r \, dr \, dz$ and out will be $\rho v_\theta r \, dr \, dz + \rho v_\theta r \, dr \, dz$ this is $\rho v_\theta r \, dr \, dz$ of $\rho v_\theta r \, dr \, dz$ into $dr \, dz$, right?

So that means this in minus out we can write to be equals to say this $\rho v_\theta r \, dr \, dz$ into $dr \, dz$ $\rho v_\theta r \, dr \, dz$ this goes out then we can write this way that minus $\rho v_\theta r \, dr \, dz$ of $\rho v_\theta r \, dr \, dz$, right? $\rho v_\theta r \, dr \, dz$ into $dr \, dz$ this is that in minus out minus $\rho v_\theta r \, dr \, dz$ of $\rho v_\theta r \, dr \, dz$, right? So in was this was for r coordinate in the θ coordinate in was $\rho v_\theta r \, dr \, dz$ $r \, dr$ is the $r \, dr$ is the this is $(m) \, dr$ has come that is why.

So $r \, dr$ into $dr \, dz$ that was for in and for the out it was $\rho v_\theta r \, dr \, dz + \rho v_\theta r \, dr \, dz$ into $dr \, dz$, right? So if we remove that, then we can say that this we can write $\rho v_\theta r \, dr \, dz$ of $\rho v_\theta r \, dr \, dz$ into $dr \, dz$ is the in minus out at the θ coordinate, okay. Similarly, for z coordinate in at the z we can write $\rho v_z r \, dr \, d\theta$ into $dr \, d\theta$ and out at the z we can write $\rho v_z r \, dr \, d\theta + \rho v_z r \, dr \, d\theta$ of $\rho v_z r \, dr \, d\theta$ into $dr \, d\theta$ times the area this area is $r \, dr \, d\theta$, right?

So this we can then write in the z coordinate in minus out at z this is equals to minus $\rho v_z r \, dr \, d\theta$, right? Into $r \, dr \, d\theta$, right? so by adding in minus out in all the three coordinates we get in all three coordinates $r \, dr \, d\theta$ and z in all three coordinates if we add, then in minus out we get minus $\rho v_r r \, dr \, d\theta$ of $\rho v_r r \, dr \, d\theta$, right? times the volume $r \, dr \, d\theta \, dz$ plus $\rho v_\theta r \, dr \, dz$ times the volume that is $r \, dr \, dz$ plus $\rho v_z r \, dr \, d\theta$ times $r \, dr \, d\theta$, right? Times $r \, dr \, d\theta \, dz$, right?

So this is on adding $r \, dr \, d\theta \, dz$ all three coordinates, right? Then, we have to also find out the accumulation, is it? We have to find out the accumulation, is it? We have to find out the accumulation and in that case what is the accumulation that we have to find out, right? So accumulation is $\rho \, \frac{d}{dt}$ in the entire volume element volume element $r \, dr \, d\theta \, dz$ there is one side $r \, dr \, d\theta$ another side and $dr \, dz$ the third side, right? So this $r \, dr \, d\theta$ is one arc and $dr \, dz$ the other two, so this is the total volume, okay.

So if we now put that mass in minus mass out is equal to accumulation this balance mass balance if we do, then we can write $\rho \, \frac{d}{dt}$ that plus $\rho v_r r \, dr \, d\theta$ of $r \, dr \, d\theta \, dz$ plus $\rho v_\theta r \, dr \, dz$

theta of rho v theta plus del del z of rho vz into r this is equals to 0, right? Because this r del r del theta del z r del r del theta del z that goes out and we get this, okay.

(Refer Slide Time: 21:11)

$$\frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r}(\rho v_r) + \frac{1}{r} \frac{\partial}{\partial \theta}(\rho v_\theta) + \frac{\partial}{\partial z}(\rho v_z) = 0$$

$$\frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r}(r \rho v_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta}(\rho v_\theta \sin \theta) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \phi}(\rho v_\phi \sin \theta) = 0$$

Spherical coordinates (r, θ, ϕ)

$\frac{\partial \rho}{\partial t}$	$\frac{\partial \rho}{\partial r}$	$\frac{D\rho}{Dt}$
------------------------------------	------------------------------------	--------------------

$$\frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r}(\rho v_r) + \frac{1}{r} \frac{\partial}{\partial \theta}(\rho v_\theta) + \frac{\partial}{\partial z}(\rho v_z) = 0$$

$$\frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r}(r \rho v_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta}(\rho v_\theta \sin \theta) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \phi}(\rho v_\phi \sin \theta) = 0$$

Spherical coordinates (r, θ, ϕ)

$\frac{\partial \rho}{\partial t}$	$\frac{\partial \rho}{\partial r}$	$\frac{D\rho}{Dt}$
------------------------------------	------------------------------------	--------------------

$$\frac{D\rho}{Dt} = \frac{\partial \rho}{\partial t} + v_r \frac{\partial \rho}{\partial r} + v_\theta \frac{\partial \rho}{\partial \theta} + v_\phi \frac{\partial \rho}{\partial \phi}$$

Then we can write this to be equals to we can write then this to be equals to del rho del t plus del del r of rho v r rho vr, right? del del r of r rho vr plus del del theta of rho v theta, right? Plus del del z of rho vz, right?

So this is equals to 0 so on accumulation we get this del rho del t plus del del r of r rho vr plus del del theta of rho v theta plus del del z of rho vz this is equals to 0, right? So one thing we have

to keep in mind of course this r which was there this r which was there if we divide all the three terms, then here in the $\frac{1}{r} \frac{\partial}{\partial r} (r \rho v_r)$ here we should have $\frac{1}{r}$, is it? That should come out there and that is equals to because in all the three out of this we had here at $\frac{1}{r}$ and we had here at $\frac{1}{r}$ at $\frac{1}{r}$ here, right?

So in that case this r and this r if we divide them, then they should be $\frac{1}{r} \frac{\partial}{\partial r} (r \rho v_r)$ and this should be $\frac{1}{r} \frac{\partial}{\partial r} (r \rho v_r)$ and this is like that, right? Now is the real expansion, so if we see that this is quite little not little quite different than that of the x, y, z or Cartesian coordinate. So we can write that in the r, θ, z or cylindrical coordinate the actual term is $\frac{\partial \rho}{\partial t} + \frac{1}{r} \frac{\partial}{\partial r} (r \rho v_r) + \frac{1}{r} \frac{\partial}{\partial \theta} (\rho v_\theta) + \frac{\partial}{\partial z} (\rho v_z)$ this is the equal to 0 is the equation of continuity for the cylindrical coordinate that is r, θ, z , right?

So this is quite different then that what we had done for the x, y, z that is the Cartesian coordinate if you remember that was absolutely different then this so many additional terms have come. Now this will be also useful when you are going for the equation of motion that derivation these relations will be helpful substituting for expanded or contracted form. So in that case there will be using these relations either in the Cartesian or in the cylindrical coordinate, right?

So we have done both then x, y, z that is the Cartesian coordinate and θ, z that is the cylindrical coordinate these two system we have shown how to derive the equation of continuity and what is the form of equation of continuity, right? Now, this we will not derive but we can say for the spherical coordinate we can say that $\frac{\partial \rho}{\partial t} + \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \rho v_r) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \theta} (\rho v_\theta \sin \theta) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \phi} (\rho v_\phi \sin \theta)$, right? Then we can write like this, $\frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \rho v_r) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \theta} (\rho v_\theta \sin \theta) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \phi} (\rho v_\phi \sin \theta)$, right?

So this is equals to 0 for the r, θ, ϕ coordinate that is spherical coordinate. So spherical coordinate we are not deriving because r, θ, ϕ that will be too much complicated and will take really a good time and to avoid that we are giving the final form of the r, θ, ϕ that is spherical coordinate the final equation is $\frac{\partial \rho}{\partial t} + \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \rho v_r) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \theta} (\rho v_\theta \sin \theta) + \frac{1}{r \sin \phi} \frac{\partial}{\partial \phi} (\rho v_\phi \sin \theta)$, right? $\rho v_\theta \sin \theta$ and $\frac{\partial}{\partial \phi} (\rho v_\phi \sin \theta)$

by $r \sin \phi \frac{\partial}{\partial \theta}$ of ρv this is, okay this is θ is there so if you mix up this is $\phi \rho v \theta$, right? $\rho v \phi \sin \phi \frac{\partial}{\partial \theta}$ so $r \phi \theta$ then we should write in this form $r \phi \theta$, right?

Second term we are writing in terms of ϕ , so $1/r \sin \phi$, right? To $\frac{\partial}{\partial \phi}$ of $\rho v \phi \sin \phi$ plus $1/r \sin \phi \frac{\partial}{\partial \theta}$ of $\rho v \theta$ is the spherical coordinate, right? So we have already seen that partial coordinate that partial derivative was $\frac{\partial \rho}{\partial t}$, then (sa) total time derivative that was $d\rho/dt$ and we also had shown that the substantial time derivative was $\rho D\rho/Dt$, right? So these three and their respective expressions also $\frac{\partial \rho}{\partial t}$ is okay, but $d\rho/dt$ we had also shown this will be required for when we were doing the equation of motion that time again it will be required.

So $d\rho/dt$ we had shown this was $\frac{\partial \rho}{\partial t}$, right? plus $\frac{\partial \rho}{\partial x} \frac{dx}{dt}$ or $\frac{\partial \rho}{\partial x} \frac{dx}{dt}$ plus $\frac{\partial \rho}{\partial y} \frac{dy}{dt}$ plus $\frac{\partial \rho}{\partial z} \frac{dz}{dt}$ this was for the $\frac{\partial \rho}{\partial t}$ this was for the this partial derivative but this was for the total derivative and for the substantial time derivative we had shown that this was $d\rho/dt$ this is equals to $\frac{\partial \rho}{\partial t}$, right? Plus this will be again required $v_x \frac{\partial \rho}{\partial x} + v_y \frac{\partial \rho}{\partial y} + v_z \frac{\partial \rho}{\partial z}$, right?

So this will be requiring when we are going for the equation of motion that set of equations we said earlier that this we call very very useful equations Navier-Stokes equation so when we will do that, all these relations will be very much useful and they are required, right? So in the next class we will do the equation of motion. Keeping in mind that continuity equation and the in the all three coordinates that is Cartesian coordinate or cylindrical coordinate or spherical coordinate in all these three coordinates we have out of those two, two we have derived and one we have shown you the final form.

So these forms will be utilized for equation of motion, but again equation of motion you will see that it is as we have progressing it is bigger and bigger, so equation of motion will be even bigger, right? So in that case it may not be possible that all the three coordinates we will be showing but at least for the Cartesian coordinate we will show, okay thank you.
